Diet and Incidence of Disease in India—S C Seal

Anaemias in Pregnancy—As the result of a statistical survey Choudhury and Mangalik found a 5·6 per cent incidence of anaemia in 2,400 confinements Of forty one cases which were studied clinically and haematologically 65·8 per cent were of the macrocytic type These cases were identical with tropical macrocytic anaemia as described by Napier The microcytic anaemias were due to an inadequate iron intake made worse by pregnancy and parturition There is no evidence to show that the anaemia of pregnant women is different from that of non pregnant women or of men Thus the authors prefer the term "anaemias in pregnancy" to "anaemia of pregnancy"

Effect of Cormed—K Thiel
Hydrochloric Acid Collargol Reaction New Cerebrospinal Fluid Test—C Riebeling
Effect of Sexual Hormones on Cock's Comb—J Morato-Munaro A S Albrieux and W Bufo

Acid Cover of Skin—The third part of this paper describes a glass-bell method which allows the determination of the number and type of organisms on different parts of the skin Investigations by this method have proved that there are fewer organisms and fewer varieties of organisms on the acid parts of the skin They have also proved that the antibacterial protection of the skin increases with the strengthening of the acid reaction as for example after sweating, when the sweat has been allowed to dry on the skin

Hydrochloric Acid-Collargol Reaction—The new test is particularly suitable for the diagnosis of general paralysis of the insane for the differentiation of various types of chronic syphilitic affections of the central nervous system and for the recognition of somatic syphilis not involving the central nervous system.

Relation between Pylorus and Benign Polyps of Stomach —J G Knoflach
Treatment of Itching Skin Affections with Ocinum —E Ettinger
Latest Publications on Health Insurance —P Horn

New Anti diphtheria Vaccines—Investigations of twenty-six adults and thirteen children after the injection of ditoxoid and of twenty-three adults after "AlFT have proved that active immunization with these vaccines does not afford protection against infection The vaccination however is advisable where there is danger of a diphtheria epidemic spreading but only when it can be carried out at least four weeks before exposure is likely The vaccinated persons must be warned that the vaccination does not afford absolute protection

Ulcer Diet Rich in Vitamins—A diet rich in vitamins particularly in vitamin C has proved beneficial in cases of recent gastric ulcer The patient must receive at least 50 mg of vitamin C a day

*Pregnancy and Renal Fragility —A Powilewicz
*Senility and Chronic Arthritis of Hip —J G Duverney

Renal Fragility—The author makes a plea for the early diagnosis of what he terms latent renal instability by means of Legueu's 'provocative shock' test The test should be tried either in early pregnancy or before incurring the risk of another pregnancy

Senility and Chronic Arthritis—The author's discussion of the age incidence of chronic arthritis of the hip is based on a review of 1 067 cases He points out the importance of early diagnosis so that treatment may be instituted while there is still a reasonable hope of its being effective

Paris vol 46 May 28 1938

*Resistance of Bones and Site of Fracture of Long Bones due to Muscular Causes —H Rouviere
*Epidemiological Data on Epidemic Encephalitis in Japan —Ryoki Inada
*Vascular Spasm *in vitro* Experimental Study of Isolated Perfused Blood Vessels —A Mougeot

Site of Fracture of Long Bones—H Rouviere discusses the various factors which combine to give the long bones

their normal resistance They include the amount of compact substance the ratio between the length and the circumference of the shaft the shape of the shaft and its cross-section the ridges for muscle insertions etc He then discusses the effect of these various factors on the site of fracture of the long bones by indirect violence

Epidemic Encephalitis—The author gives an account of an elaborate investigation into the history distribution mode of spread aetiology etc of this disease He compares it with epidemic encephalitis in Europe which would appear to be quite different at any rate as regards the mortality curve of the disease in Europe and in Japan Inada is inclined to the view that the Japanese variety is spread by a mosquito but states that this is not yet definitely established

Vascular Spasms—A Mouzon describes the action on isolated strips of blood vessels kept alive by immersion in Tyrode's solution of various chemical agents such as alkali oxygen carbon dioxide splenic suprarenal and pituitary extracts barium chloride histamine acetylcholine pepsin etc The author also investigated ten illegal antimorbids but found the only active spasmolytic *in vitro* were the nitrites and carbon dioxide

Course and Lethality of Tuberculosis at Different Age Periods (Ger)—S Magnussen
Two Atelectasis with Recurrent Appearance Remnants of Basal Mediastinal Pleurisy (Eng)—H Hallander

Vitamin C—A significant hypovitaminosis C develops during progressive tuberculosis in the guinea-pig and is demonstrable by quantitative analysis of the vitamin C content of the urine during life and of the suprarenal glands post mortem The urine and suprarenal gland vitamin C deficit is rapidly and adequately overcome during the early tuberculous infection by a daily oral administration of 10 mg of *l*-ascorbic acid Hypovitaminosis C renders the animal organism more vulnerable to progressive tuberculosis

Types of Tubercle Bacilli—In type determinations in about 5,000 cases of tuberculosis from various parts of Denmark the authors found fourteen cases of so-called mixed infections Eight cases were selected—that is they were discovered by carrying out serial examinations in patients in whom a bovine infection had previously been demonstrated The remaining six cases were discovered accidentally Of 100 patients—with pulmonary tuberculosis produced by the bovine type of tubercle bacillus—who were under observation up to one year only two were found to show a double infection but of seventeen observed for from one to four years no fewer than nine were found to have turned into a mixed or double infection The authors conclude that the present methods of type determination are not sufficiently accurate for the sure application of the term type to the two mammalian bacilli

† After the title of each article in this journal an indication is given of the language in which it is written thus Ger means that the paper is in German Eng that it is in English

Spontaneous Bone Tumours of Mice—F C Pybus and E W Miller
Transmissible Leukaemia in A Strain of Mice—J H Lawrence and W U Gardner
Chromosomes in Man—E Schwarz

Embryonal Renal Adenosarcomas—Masson studied complex adenosarcomas of the kidney from three children, using neurological impregnation as well as the usual histological methods He describes nephrons in various stages of differentiation mesenchymatous elements which in part become muscular and sympathetic elements which form neuroblasts and ganglion cells All these seemed to develop from a single blastema which combined therefore the characteristics of the neural crests and the renal blastema It is suggested that in normal embryogenesis certain striated muscles and the nephrogenic tissue originate from the mesectoderm of the neural crests If this is true, the displacement and precocious neoplasia of some elements of this neuro epithelium may be the source of mixed tumours of the kidney

Chemical Compounds as Carcinogenic Agents—In this valuable review Cook and Kennaway summarize 180 papers published during 1937 and concerned with the carcinogenic activity of chemical compounds It forms a continuation of the important review which the authors and their colleagues published in 1937

Subcutaneous Emphysema complicating Bronchial Asthma Report of a Case and Analysis of Seventeen previously Reported Cases—L Rosenberg and J Rosenberg

Invasive Properties of Haemolytic Streptococci—The mortality in blood stream infections due to haemolytic streptococci varied in 166 patients from 53 6 per cent in cases of mastoiditis and otitis media to 85 7 per cent in erysipelas and cellulitis In cases with meningitis 95 per cent succumb and in peritonitis the mortality is perhaps still higher The remarkable therapeutic effect of sulphanilamide on haemolytic streptococci is most pronounced in the early stages of these infections It may fail to sterilize foci of latent infection in the tonsils Intoxications by the drug especially the most serious types of these are rare and are probably due to individual idiosyncrasies

Mortality and Longevity of Diabetics—There has been a continuous decline in the death rate of diabetics which in the period 1926 to 1929 was 75 per cent lower than that of 1897 to 1913 The gains have been greatest in young diabetics The decline in mortality became more rapid after the introduction of insulin There is a large increase in the expectation of life, which at the age of 10 is held to be about thirty years and which becomes progressively less with advancing age The death rates for diabetics are still much in excess of those for the general population

Subcutaneous Emphysema complicating Bronchial Asthma—A case of widespread subcutaneous emphysema complicating an attack of bronchial asthma in a girl aged 3 is described Although the condition presents an alarming picture it usually has a good prognosis A series of seventeen similar cases collected from the literature is analysed

Study of Results of Treatment of Pulmonary Tuberculosis in Mexican and White Patients—F R Harper
Tuberculosis Survey in Jamaica—E W Flahiff

Extrapulmonary Primary Tuberculosis—This is a study of the calcified foci in 132 necropsies made with the object of determining the percentage occurrence of each portal of entry in the community In 73 5 per cent the primary infection involved only the lungs and hilar lymph glands This figure became 79 when cases having multiple portals of entry were added In 8 3 per cent the gastro intestinal tract was the sole portal of entry, it was the portal of entry in 12 9 per cent when the cases of multiple portals of entry were added The corresponding percentages were 1 8 and 4 5 for cervical and head primary lesions (considered together) There were 2 per cent pleural primaries 2 3 per cent "cryptic" lesions in the liver or lymph glands with no demonstrable focus of lesion 2 3 per cent doubtful cases and 5 3 per cent in which no calcification was found In 30 6 per cent of the cases primary haematogenous calcifications were found in the liver and spleen

Retrogressive Changes of Tubercles—The changes that take place in the ageing of primary tubercles depend upon the following factors autolysis or enzymatic digestion of the

that have been killed by chlorination of this digest and the proximity of these elements to the circulating fluids of the body which permits of resorption and ossification. The penetration of the capsule by capillaries may eventually cause the removal of remnants of calcified cretaceous material and perhaps even of bone tissue.

Flotation Method.—In 1 per cent. of smear negative specimens and 19 per cent. of smear negative persons were shown to have tubercle bacilli by this method. Flotation smears showed in average of eighty-five times as many acid-fast bacilli as direct smears. The advantages of flotation over sedimentation procedures are better distribution of tubercle bacilli and cleaner smears.

Complete Atrioventricular Dissociation Due to Digitalis with Alternating Effect of Overdosage. Case Report.—T. J. Dry and G. A. Kerkhof.

Mercurial Suppositories.—Mercurin suppositories which are said to be identical with novurit suppositories were used on patients with varying degrees of cardiac failure and a satisfactory diuresis was obtained in 85 per cent. Ammonium chloride should be given in addition. The treatment was of little avail in two cases of hepatic cirrhosis with oedema and observations on cases with renal complications suggest that the mercurial compound may be actually harmful in these conditions.

Response to Cevitamic Acid.—The urinary excretion of vitamin C in the three hours following the intravenous injection of 100 mg. of cevitamic acid was used as a measure of vitamin C deficiency. Normal subjects excrete about 40 per cent. of the vitamin C thus administered while cases of scurvy excrete only a trace. Tests using larger doses of cevitamic acid were found to possess no advantage. Observations on the effect of prolonged administration of vitamin C showed that the amount required to raise the urinary excretion to normal was proportional to the degree of deficiency.

Bile in Peptic Ulcer.—The effect of the administration of bile in cases of peptic ulcer was tried because of reports that interference with the normal flow of bile in man and animals is associated with lesions of the gastric and duodenal mucosa. Forty patients with ulcer were treated with bile and carefully followed for periods up to two years. The results show clearly that bile has no beneficial effect in the disease.

Malarial Treatment of Syphilis.—Bering and Memmesheimer summarize their experiences in the treatment of 1,400 cases in which malarial treatment was preceded by injections of bismuth and followed by injections of salvarsan. Over 60 per cent. of the cases were subsequently followed. With fully developed general paresis a slight improvement may occur or the disease may remain stationary. In other cases there was however swift progression. In incipient paralysis marked improvement often occurred even to restoration of working capability at intellectual pursuits although this might be preceded by transient mental deterioration immediately after the malaria. In established and incipient tabes dorsalis cessation of progression might result but some cases did not react. In both diseases improvement in the spinal fluid tests might or might not run parallel with the clinical changes. In those cases with positive change in the spinal fluid without physical signs the reversal of the change following malarial treatment is almost invariable and in no case did paralysis or tabes develop subsequently.

Spirochæta pallida in Artificial Culture.—The author refers to the interest which has been taken in the subject of artificial cultivation of the spirochæte of syphilis since the organism was discovered in 1905 and to the absence of satisfactory evidence that the disease has been produced in susceptible animals by the inoculation of culture material. His own experiments in this respect have been negative. His present work is based on the discovery by Marchionini that the *Spirochæta pallida* destroys diastatic ferment. He describes the technique of his experiments which showed that spirochætes from the syphilitic lesions of human subjects or animals destroyed the ferment almost completely whereas the culture material produced only a slight effect. He believes this evidence taken in conjunction with previous work supports the prevailing opinion that these cultures do not contain true *Spirochæta pallida* but other spirochætes which are probably harmless saprophytes obtained from the genitalia.

Nystagmus —J Ohm
Experimental Observations on Origin of X Ray Cataract —H Goldmann and A Liechti

Contractility of Lens Fibres —A comprehensive review is given of the literature on the subject After considering experimental observations with such substances as acetyl choline and histamine the author concludes that the lens behaves like striated muscle and takes an active part in accommodation

Vitamin C and Senile Cataract —After making observations on forty four patients with senile cataract the conclusion is reached that there is a disturbance not only in the metabolism of vitamin C in the lens in such cases but also in the body as a whole

Ocular Aspects of Endangiitis Obliterans —The author gives a detailed report of the eye changes in a patient diagnosed at one time as suffering from choroiditis and at another as a case of disseminated sclerosis ultimately proved to be a case of endangiitis obliterans The multiplicity of appearances seen in this affection are discussed

Archiv fur Psychiatrie und Nervenkrankheiten

Berlin vol 108 April 29 1938

Systematic Atrophies a Well defined Group of Hereditary Diseases of Central Nervous System —H Spatz
*Endemic and Epidemic Disorders of Thyroid Gland and their Relation to Soil and Climate —F Wolter
Contribution to Functional Organization of Corpus Geniculatum Laterale of Man —A Juba
*Statistical Contribution to Problem of Acute and Chronic Epidemic Encephalitis —H Nagel
Rapid Method of Impregnation of Connective Tissue of Central Nervous System of Especial Use for Tumours —L Bonkalo
Problem of Chronic Poliomyelitis —H Lange
Chemistry and Psychiatric Shock Therapy —J Schuster
Systematic Atrophy of Superior Olive —E Weisschedel
Forms of Superstition in Black Forest —K Beringer
Two Cases of Tumour of Trigeminus with Mid brain Symptoms —W Birkmeyer and J Silberpfennig

Endemic and Epidemic Thyroid Disorders —F Wolter provides an exhaustive discussion of facts and theories relative to the aetiology of endemic goitre In his view the theory of iodine deficiency can no longer be maintained and the aetiology is to be sought in the nature of the soil deficiency of sunlight and a largely windless atmosphere with increased radio activity of the air nearest the ground

Acute and Chronic Epidemic Encephalitis —Nagel analysing the hospital figures of Munich finds two [redacted] to every female among the chronic encephalities The years 1918 and 1919 provided more cases than any other years There has been a slight increase in acute encephalitis since 1934 The disease has shown no change in character In nearly half the chronic cases there is no definite history of previous encephalitis and in 14 per cent no history of any definite illness Half the cases had an interval of about two and a half years between the acute and chronic stages and 36 per cent showed no such interval

Archives of Diseases in Childhood

*Treatment of Renal Rickets —G Graham and W G Oakley
Case of Periarteritis Nodosa with Subcutaneous Lesions Recovery —C W Vining
Congenital Steatorrhoea due to Pancreatic Defect —M H Harper
*Administration of Thyroid Gland to Premature Babies —A Moncrieff
Undulant Fever in Children —D H Paterson and C Hardwick
Standard Intravenous Glucose Tolerance Test —T Crawford

Renal Rickets —Two patients with renal rickets were treated with sufficient alkali to restore the alkali reserve to within normal limits and at the same time with large doses of vitamins A and D The lesion of the kidney in renal rickets is a peculiar one and tends to progress very slowly Complete tests of the blood and urine in the cases are described with many radiographs The general condition of the children improved, they grew in height and their weight increased The state of the kidneys also slightly improved as did the condition of the bones Many references are given

Thyroid Therapy of Prematurity —The administration of thyroid gland to premature infants appears to exert a beneficial effect A large number of premature infants have been treated The dose is 1/20 grain per lb body weight daily In a controlled investigation the mortality rate in a group receiving thyroid was only one third of that in the control group Reasons are given why better gains in weight are not obtained and the opinion of the nursing staff is mentioned as emphatically in favour of thyroid administration as rendering small babies easier to manage as regards feeding and keeping them warm

Tuberculous Spondylitis Clinical and Statistical Surveys of Cases at the Istituto Rachitici from 1903 to 1937 —A Poli
Congenital Talipes Its Regional Distribution as compared with that of Dislocation of Hip and Congenital Torticollis —A Poli
*Mechanical Treatment of Scoliosis —A Albanese
*Congenital Dislocation of Hip and Blood Groups —E Tranquilli Leali
Cuneiform Osteotomy of Astragalus in Treatment of Deformities of Foot —C Schapira
Clinical and Statistical Study of 1 583 Cases of Poliomyelitis —A Mazzoni and F Vecchione
Orthopaedic Apparatus for Correction of Pronated Forearm —I Racheli

Mechanical Treatment of Scoliosis —This is a review based on 1 245 cases of the response of various components of the deformity to gymnastic, physiotherapeutic and mechanotherapeutic measures The last named include the use of two machines (here illustrated and briefly described) introduced by Professor Galeazzi

Congenital Dislocation of the Hip and Blood Groups —A connexion is mooted between a vitium primae formationis on the one hand (congenital dislocation of the hip being an example) and constitutional disharmony of spermatozoal origin on the other In seventy cases of congenital hip deformity 20 per cent came from parents of the same and 80 per cent from parents of different blood groups The corresponding proportions in controls were 72 and 28 per cent The biochemical racial indices in different parts of Italy are summarized there is some evidence that congenital dislocation of the hip is commoner where the index is high

Beitrage zur Klinik der Tuberkulose

Berlin vol 91 April 1938 Heft 4

Psychological Symptomatology of Pulmonary Tuberculosis —G Klose and N Erwin
Ascorbic Acid (Vitamin C) in Treatment of Pulmonary Tuberculosis —J Trautwein
Bronchiectasis in *Situs viscerum inversus totalis* —K Glaum
Inflammation of Serous Membrane in Tuberculosis —V Dietz
Contribution to Application of Pneumoperitoneum —H Zwerg

Specific Prevention and Treatment of Tuberculosis by Allergy produced with Killed Tubercle Bacilli embedded in Lanolin or Vaseline—A Contribution to the Problem of Tuberculous Immunity—G Hensel
Experiences with Positive Tuberculin Reactions in Treatment of Surgical Tuberculosis—F Wesserer
Surgical Considerations in Lung Suppuration—K Waldschmidt
Treatment of Pulmonary Tuberculosis by Intrapleural Pneumothorax—F Kathberg

Pneumoperitoneum—It is suggested that the sudden lowering of the intra-abdominal pressure after peritonitis could be avoided by inducing a pneumoperitoneum. This procedure might prevent exacerbation of a coexisting pulmonary tuberculosis.

Lupus—This paper deals with 600 patients seen at the Breslau University skin clinic. The following factors are examined: distribution as regards town or country and sex; the fate of the patients from the point of view of the age at which the condition developed; its pathogenesis; a history of tuberculosis in the family; localization of the lesion; involvement of mucous membranes; and tuberculosis elsewhere. Over 50 per cent. of the patients in the Breslau clinic were cured or much improved.

British Journal of Radiology

London vol. 11 [illegible]

Tests for Respiratory Efficiency and Their Correlation with Radiological Appearances in Lungs—E. M. K[illegible]
Kidney Stones: Study of Excretion of Drugs by Intravenous Pyelography—A. L. P. K. J. Franklin and R. G. M. Both
Factors which Determine Diagnosis in Cancer—C. I. S[illegible]

Silicosis in Pottery Workers—The confluent type of silicosis is a fairly common among pottery workers but it may also be found in stone workers and in workers in the South African mine. There appears to be no typical picture for one type of worker and the evolution of the disease probably depends on the patient's condition, the type of dust and the presence or absence of infection. This may account for the fact that men employed at the same type of work and for the same length of time may present completely different pictures.

Occupational Lung Diseases in Agricultural Workers—Agricultural workers are liable to infection by organic matter, the microfungi, bacteria and parasites which exist in vegetable matter and in the excreta of farm animals. Various types of mycotic infection of the lungs are described and the radiological appearances illustrated. The author is of the opinion that the common microfungi, though usually innocuous, may become pathogenic under certain conditions.

Effect of Sympathetic Stimulation Occurring after Shock from Haemorrhage—N. E. Freeman, S. A. Shaffer, A. E. Shetter and H. E. Hollin[illegible]

Insulin and Blood Uric Acid—Subcutaneous injection of 1 to 2 units of insulin per kilogramme body weight causes a marked fall in the concentration of uric acid in human blood. The fall is independent of the appearance of hypoglycaemia but it occurs when hypoglycaemia is allowed to develop and not when it is prevented by the administration of carbohydrate.

Heat Stroke—Cardiac failure or peripheral circulatory collapse was not evident in the majority of the forty-four patients studied and the sodium chloride content of the blood was not significantly altered. There was, however, a moderate acidosis and haemoconcentration. The high body temperature proved to be the chief cause of the symptoms of heat stroke. Old age, degenerative disease and acute alcoholism are important contributory factors in heat stroke. The onset was precipitated by a diminution or cessation of sweating in the majority of patients but the primary causes of this change are not known. Measures to lower the body temperature promptly are indicated; ice-water tubbing with massage being the most effective method in severe cases.

Evaporation of Body Water in Lobar Pneumonia—The body weight of children suffering from lobar pneumonia is found to be increased. The insensible water loss through the skin is less than that which usually occurs in other fevers. It is at the same level as that of the normal skin before the crisis and it is greatly elevated only at the time of the crisis after which it decreases. The lung vaporization is highest during the febrile period. The skin temperature rises to correspond with the rectal temperature.

Journal of Laryngology and Otology

London vol. 53 May 1938

Otogenous Non-purulent Encephalitis—E. Jefferland
Observations on Variations in Hearing in Otosclerosis—Stephen Suggit
Mesial Dermoid Cyst of Nose occurring in Twin Boys—F. Webster Finn
Transparent Cast of Labyrinth: Improved Method of Preparation—E. W. Pest

Otogenous Encephalitis—Otogenous non-purulent encephalitis is a rare condition usually diagnosed as cerebral abscess. Jefferland describes one typical case in which a radical mastoid operation was performed; exploration of the cerebrum and cerebellum revealed nothing abnormal. The symptoms slowly disappeared and the patient made a complete recovery after three months. The existence of this condition must be borne in mind, otherwise too free and dangerous incisions of the cerebrum and cerebellum may be practised in the hope of finding an abscess.

Otosclerosis—In following up the work of A. A. Gray on otosclerosis Suggit studied the effect on the hearing of the introduction of 2 to 3 c.c.m. of normal saline into the middle ear by way of the Eustachian tube. This was done in eleven patients with characteristic symptoms and signs of

otosclerosis The results were negative Although some of the patients showed improvement critical examination failed to place the improvement in the hearing outside the limits of normal variation The variations in the hearing of otosclerotic patients over periods of up to twenty-two months were studied in a further fifteen persons who did not receive any treatment The hearing tests were made with the audiometer and the results are given in the form of graphs reproduced in the text

Gonococcal Arthritis —C S Keefer
Treatment of Advanced Cardiac Decompensation —B E Hamilton and C A Schuck

Migraine —When the four cardinal symptoms—recurrent hemicranial headache visual disturbances such as scintillating scotoma vomiting and nausea and a family history of migraine epilepsy or allergy—are present the diagnosis is definite Treatment of the attacks by means of the parenteral administration of 0·25 to 0·5 mg of ergotamine tartrate preferably during the premonitory symptoms gives rapid success the most rapid response is obtained after the intravenous injection of 0·25 mg Oral administration should be tried with 5 mg followed by 2 mg each hour until a total of 11 mg has been given Two injections (2 mg) of 20 mg by mouth may be given each week for long periods Unpleasant symptoms (nausea etc) should not alarm the patient or the doctor Gastric symptoms may be ameliorated by 1/120 grain of atropine sulphate pains and paraesthesiae by massage or exercise

Meniere's Disease —Eight patients were treated by severing the vestibular part of the eighth cranial nerve or if deafness was present by sectioning the entire eighth nerve There was no mortality and in seven cases complete alleviation of the attacks of vertigo was obtained Of eighteen patients treated on the lines of Festenberg's low sodium diet twelve recovered completely

Pulmonary Tuberculosis —The importance of x ray examination in the differential diagnosis of pulmonary tuberculosis and other lung complaints is emphasized This is especially so in cases where the area of consolidation is small or deeply seated Other important signs and symptoms are a family history of tuberculosis, a sudden haemoptysis or a primary pleurisy with or without effusion Also important is the examination of the sputum for tubercle bacilli the physical character of the sputum in absence of any leucocytosis and a positive tuberculin test in early childhood Primary infection in the apical subapical or any other part of the lung is more common in children than in adults, and may appear as a lobar pneumonia or bronchopneumonia

Protamine Zinc Insulin —Protamine zinc insulin has been used alone in thirty one cases and together with ordinary insulin in thirty four cases It acts slowly, but continues its action over a period of forty eight hours This allows the number of injections to be reduced to one a day but it can also produce hypoglycaemia especially after physical exercise or as the tolerance improves Even a severe attack of hypoglycaemia can easily be checked by means of adrenaline and intravenous glucose In order to avoid local skin complications the injections should be spread over a wide area

Why Lactogen so adequately replaces Breast Milk

where natural Feeding is deficient or impossible

Scientifically and in actual practice, Lactogen resembles Baby's natural food as closely as is possible. Both the proportions of its food elements and its physiological character are practically identical The homogenisation process reduces the fat globules to a size even smaller than those of breast milk. The curd is light, flaky and easily digested The vitamins remain practically unaltered, and the mineral salts are presented in an assimilable form That is why babies who are deprived of their natural food thrive so well on Lactogen

LONDON HOSPITAL MEDICAL COLLEGE & DENTAL SCHOOL

THE WINTER SESSION will Open on Monday, October 3rd

The LONDON HOSPITAL serves the East End of London and with eight hundred and ninety beds is the largest voluntary Hospital in Eng The Out patient Department which deals with a hundred thousand new patients per annum is extensively used for teaching

The size of the Hospital necessitates a large number of resident medical officers Every year seventy resident house physicians and house surgeons eighty salaried non resident clinical assistants are appointed from among recently qualified students The opportunities which these appointments offer for obtaining clinical experience is invaluable

The MEDICAL COLLEGE is attached to the Hospital and is staffed by Professors of Anatomy Physiology Bacteriology Chemical Pathology Anatomy and Medicine of the University of London

SPECIAL COURSES in Anatomy and Physiology for the Primary F R C S and Advanced Courses in Surgery for the Final F R C S Examination in Medicine for the M D and M R C P Examinations are held twice a year

ENTRANCE SCHOLARSHIPS AND PRIZES of the total value of £950 are awarded annually Research Funds to the value of £11 000 per annum assistance being given to students and graduates engaged in medical research

The MEDICAL COLLEGE contains a modern Museum of Pathology and a Library provided with all the current medical periodicals in charge of a full time Librarian There is also an Athenaeum Club and Dining Hall a Gymnasium a Fives Court and two Squash Courts in the Students House The Athletic Ground of 13 acres at Hale End is within easy distance of the Hospital

The HOSPITAL is only 20 minutes from Charing Cross and Baker Street Stations For those who wish to live in immediate proximity to the Hospital there is accommodation for sixty students in the Students Hostel

Further details may be obtained from the Dean Dr A E CLARK KENNEDY M D F R C P Physician to the Hospital and Fellow of Corpus Christi College Cambridge who is always pleased to meet students wishing to see the Hospital and College and to whom application for admission should be made Turner Street London E 1

KENT COUNTY COUNCIL

PUBLIC HEALTH DEPARTMENT

CONSULTANT OPHTHALMIC SURGEON

The County Council invites applications from registered medical practitioners (not over 45) qualified and experienced in ophthalmic work for appointment as Consultant in Ophthalmic Surgery to the Council's Ophthalmic Scheme. The Consultant appointed will be required (a) to attend cases in the Urban Districts of Chatham and Sevenoaks and Swanscombe (b) to receive either in his own or in other suitable premises and (c) to advise and (d) to appear as an expert witness when required by the County Council in matters of ophthalmic importance.

Consultations will be arranged by medical practitioners but the consultant will be required to attend cases in the case of the County Medical Officer and in accordance with such other requirements as may be prescribed from time to time by him.

The remuneration of the consultant will be as follows:

	£	s	d
For consultations at or within one mile of the County Hall	2	2	0
Up to 5 miles	3	3	0
From 5 to 10 miles	4	4	0
From 10 to 15 miles	5	5	0
Over 15 miles	6	6	0

The appointment will be at the pleasure of the County Council and the arrangement will be reviewed at the end of the first year.

Forms of application and if required further details of the appointment can be obtained from the County Medical Officer, Sessions House, Maidstone, to whom completed application forms should be returned not later than August 11th, 1938.

W. L. PLATTS,
Clerk of the County Council.

Sessions House, Maidstone.
July 26th, 1938.

The Agency has made arrangements for special facilities on very favourable terms, to be afforded to approved purchasers for the advance of part of the premium for any suitable practice or partnership Full details on application.

BELLERGAL

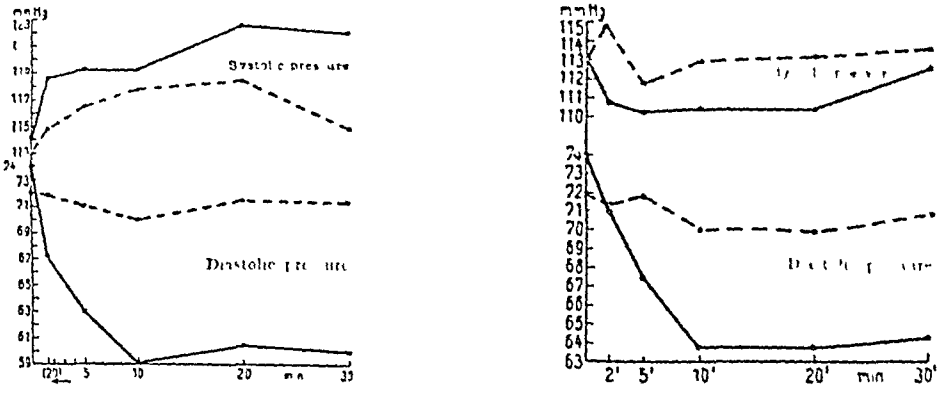
INHIBITS AUTONOMIC HYPEREXCITABILITY

Experimental and clinical investigations by Jores and Govert (1936) — Deutsche Med. Woch. 1936

OCULOCARDIAC REFLEX DERMOGRAPHISM RESPIRATORY ARRHYTHMIA BEFORE AND AFTER BELLERGAL TREATMENT

Before Bellergal Treatment			After Bellergal Treatment		
Oculocardiac Reflex	Dermographism	Respiratory Arrhythmia	Oculocardiac Reflex	Dermographism	Respiratory Arrhythmia
— 6	+ 12	— 2	17	+ 18	— 19
+ 12	w +	17	1	+	1
+ + 1	r w l	1	0	+ + 0	0

Under oculocardiac reflex [illegible] not only [illegible] but [illegible] what [illegible] white dermographism [illegible]



It is seen that the oculocardiac reflex was negative in only 6 cases before treatment with Bellergal but in 17 cases after treatment white dermographism was observed in 12 cases before but only in one case after treatment, respiratory arrhythmia present in 18 cases disappeared except in one case

RESPONSE OF THE BLOOD PRESSURE TO AUTONOMIC STIMULANTS BEFORE AND AFTER BELLERGAL TREATMENT

Action of Adrenaline — Action of Pilocarpine

—— Before Bellergal treatment

- After Bellergal treatment

In subjects with a labile autonomic nervous system Bellergal diminishes the exaggerated reactions especially of the diastolic pressure to stimulants of the autonomic nervous system such as adrenaline and pilocarpine It also inhibits the action of adrenaline and pilocarpine on the pulse temperature oculocardiac reflex dermographism and respiratory arrhythmia

Clinically, 40 cases exhibiting marked irritability of the autonomic nervous system were treated with Bellergal They included a series of neurogenic disorders of various forms nervous heart troubles without organic basis stomach troubles of the ulcer type without an ulcer being demonstrable ulcer and spastic constipation By treatment commencing with 2 tablets of Bellergal three times daily gradually decreasing to small doses we obtained in all cases a marked improvement and even complete disappearance of the symptoms in the majority of cases Secondary effects were never observed The preparation may truly be described as a very effective remedy for the sedation of numerous conditions of hyperexcitability of the autonomic nervous system

Valentine's Meat-Juice

In Typhoid Fever, Diarrhoea and Cholera Infantum, when it is Essential to Sustain the patient without irritating the Digestive Organs, the Ease of Assimilation and Power of Valentine's Meat-Juice to Restore and Strengthen has been demonstrated in Hospital and Private Practice.

THE quickness and power with which VALENTINE'S MEAT-JUICE acts, the manner in which it adapts itself to and quiets the irritable stomach, its agreeable taste, ease of administration and entire assimilation recommend it to physician and patient

Physicians are invited to send for brochures containing clinical reports

EARLY VEGETABLE DIET for OPTIMUM NUTRITION of INFANTS

It is now widely admitted that vegetable foods should supplement the milk diet of infants as early as possible The difficulty in prescribing these foods at an early age has however hitherto been the fact that the weak digestions of infants cannot successfully deal with the fibrous cellular tissue, which therefore causes intestinal irritation and consequent upset, frequently manifested by diarrhœa

The Libby method of Homogenization disintegrates this tough, indigestible cellular fibre, thus enabling it to be easily eliminated the 'bulk' however being in no way affected This breaking down of the fibrous walls also has the advantage of enabling the full nutriment to be thoroughly assimilated

Libby's Homogenized Vegetable Foods for infants are prepared in six scientifically formulated combinations of Cereal, Vegetables and Fruit These can be prescribed as needed to provide the necessary balance of Vitamins, Minerals and other essentials

The accompanying table shows the comparative results of carefully controlled experiments with supplementary vegetable diet

AVERAGE TOTAL INCREASES IN HEMOGLOBIN AND ERYTHROCYTES AFTER SUPPLEMENTING THE MILK DIET WITH HOMOGENIZED VEGETABLES OR STRAINED VEGETABLES

Food	Per Cent Increase Above Anæmic Level Hæmoglobin	Red Blood Cells
Specially Homogenized Vegetables (carrots, spinach, peas)	89	117
Commercially Strained Vegetables (carrots, spinach, peas)	76	84
Home Strained Vegetables (carrots, spinach, peas)	80	95

Samples together with clinical data and laboratory reports will be gladly supplied upon request to Messrs Libby McNeill & Libby, Ltd, 15, Lime Street London, E C 3

CORSETS AND POSTURE

No. 1

Typical Illustration of posture correction. Picture of Lieutenant-Colonel before and immediately after the application of the Spencer Corrective Support. Interval of a few minutes between pictures. No. 1A.

No. 2

No. 3

Showing Front Elevation

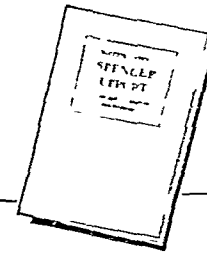
The value of Spencer Supports in correcting posture has long been recognised by thousands of doctors who use them regularly.

When we improve posture through a Spencer Corset or Support we call this INDIVIDUAL DESIGNING. Each Spencer Support is designed to meet the individual needs of the patient from complete measurements and figure description taken by a trained Corsetiere.

The Spencer either the Belt or the Supporting Corset is designed in two sections to give adequate abdominal support and uplift and correct back support.

SUPPORTS FOR

Maternity	Movable Kidney	Hernia	Pendulous Breasts
Enteroptosis	Sacro-iliac Strain	Post-operative	Pendulous Abdomen



BEWARE OF SUBSTITUTION.—Spencer Corsets fulfil every requirement of a well-designed Support, often in circumstances where lesser appliances prescribed as Spencer Supports or Corsets of another make fail, because the makers do not understand the Spencer principle of individual designing. Insist upon Spencer Support bearing the SPENCER Label.

Trained Spencer Corsetieres are resident throughout the Kingdom. Name of nearest Establishment supplied on request.

A skilful Specialist trained by Spencer Corsetieres will call at any address at your patient's convenience, by appointment, to fit your supports.

Spencer Supports and Corsets are never sold in shops

May we send you this New Professional Booklet describing Spencer Supports and their Accepted Uses?

Please send me your illustrated booklet. I am particularly interested in supports for

Name *Dr.*

Address

Question . . . . .

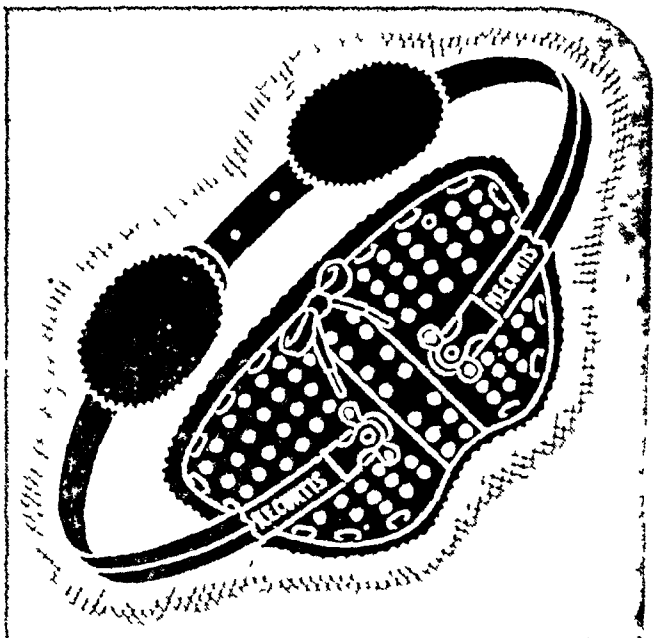
What gives the most effective abdominal support?

Answer DIRECT anterior posterior pressure

Question *How does it?*

Answer It gives even, positive pressure where the body most needs it

Question *Where is this form of support found at its best?*



Answer In the Curtis Abdominal Support No. 1

Question *What are its outstanding features?*

Answer No undue constriction of the lower abdomen. Extremely light. Maximum support is combined with complete freedom of the hips. Medically approved in the treatment of all forms of abdominal ptosis—visceroptosis, enteroptosis and gastroptosis—and for the support of scar tissue during consolidation

For your attention—A NEW NATURAL FRUIT JUICE

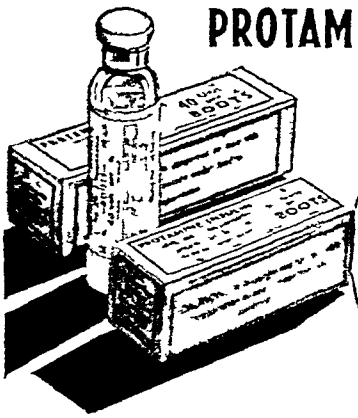
If your patients would like a new fruit juice in their diet you can safely recommend Dole Pineapple Juice the pure, unsweetened juice of luscious Hawaiian Pineapples Besides being a delicious refreshing drink it is a good source of vitamins A, B and C and natural fruit sugars The typical analysis below shows you what Dole Pineapple Juice is composed of

TYPICAL ANALYSIS

Moisture	85.3 %	Crude fibre	0.02 %
Ash	0.4 %	Titratable acidity expressed	0.9
Fat (ether extract)	0.3%	Reducing sugars as invert sugar	12.4
Protein (N × 6.25)	0.3%	Carbohydrate other than sugars (by difference)	0.38

If you would like to taste this tangy drink we will be pleased to send you a sample tin on receipt of your name and address

2000 doctors have already availed themselves of this offer Pure unsweetened packed by the exclusive Dole Fast Seal Vacuum Packing Process



Dole Pineapple Juice comes from Hawaii and is the juice of sun-ripened Pineapples

A VALUABLE, DOUBLE-ACTION ANTISEPTIC*

Local treatment with Sphagnol Peat Ointment gives rapid relief in the most obstinate cases of psoriasis haemorrhoids eczema and skin eruptions. The reason is that Sphagnol has a twofold action. First of all it soothes and allays irritation and burning sensations secondly the natural antiseptic properties of the peat distillates assist in general treatment. Sphagnol has proved beneficial over and over again where persistent resistance has been encountered.

In case you have had no personal experience of Sphagnol we shall be pleased to send you a clinical size sample for testing if you will write to Peat Products (Sphagnol) Ltd. Dept. B.M.J. 21 Bush Lane London E.C.4

CONTAINS DISTILLATES OF PEAT

OVALTINE

IN SICKNESS AND CONVALESCENCE

THE impairment of digestive powers which is commonly met with in the feverish patient combined with the lack of desire for food often aggravates the difficulty of adequately replacing the increased loss of energy and destruction of tissue which occur

Ovaltine provides a satisfactory solution to the problem of alimentation in many cases of sickness and in the stage of convalescence after severe prolonged and debilitating illnesses where an easily assimilable palatable and concentrated nutrient is required It is always acceptable

Ovaltine replaces with advantage the ordinary milk preparations which so often prove distasteful to the invalid Prepared from full-cream milk eggs and malt extract in carefully balanced proportions it provides complete nourishment in the most readily assimilable form

Efficient urinary antisepsis

Cystitis usually associated with bacilluria is among the commoner and more distressing conditions which the practitioner is called upon to treat The cloudy and ill-smelling urine the discomfort arising from the irritation of the lining of the bladder and urethra and the consequent general physiological disturbance, create a syndrome familiar to every doctor

In these cases, prompt relief is nearly always afforded by 'Cystopurin (which is a brand of Hexamethylenetetramine with Sodium Acetate) 'Cystopurin is effective in either alkaline or acid media It is excreted both in the bile and in the urine and in each of these fluids exercises its antiseptic qualities In affections of the bladder and the other parts of the urinary passage it acts not only as a germicide but at the same time soothes the inflamed membranes relieves the discomfort, and both increases the flow and removes the cloudiness of the urine

Cystopurin', being prepared in tablet form, is easy of administration It is not dependent for its action upon decomposition by the acid contents of the stomach, and is readily absorbed

LONDON SATURDAY AUGUST 13 1938

THE PREVENTION AND CONTROL OF PUERPERAL SEPSIS, INCLUDING ITS MEDICO-LEGAL ASPECTS*

BY

R. W. JOHNSTONE, C.B.E., M.D., F.R.C.S.Ed., F.C.O.G.

Professor of Midwifery and Diseases of Women, University of Edinburgh

There is no question that conditions in regard to puerperal infection have considerably improved during the present generation but we are far from having reached any irreducible minimum in its incidence. What we have achieved is a fairly complete understanding of its causes. We know something about the conditions upon which the patient's resistance depends and that toxæmia, haemorrhage, exhaustion and malnutrition depress it. We know that trauma and haemorrhage diminish the local resistance of the tissues. We know the common sources of the most dangerous organisms and we have learned a good deal regarding the methods of preventing their access.

Types of Infecting Organism

To make my subsequent arguments clear let me say at the outset that broadly speaking there are two types of infecting organism to be guarded against. There are first the organisms commonly found in the skin of and around the vulva, on the hands and clothes and on unsterilized dressings and instruments—for the most part anaerobic and non-haemolytic streptococci, staphylococci and coli-form organisms. These organisms most commonly give rise to infection after labours in which there has been considerable injury of the tissues. They cause a true wound infection and against them our preventive methods are essentially the same as those adopted in surgery. Secondly, there is the haemolytic streptococcus associated with scarlet fever and erysipelas but most commonly with tonsillitis, nasal infections and morbid conditions of the upper air passages generally. The view that this organism is the cause of many puerperal infections and of the vast majority of the fatal cases seems to have been proved by the work of Smith (1927, 1931, 1933), Paine (1931, 1933), Leonard Colebrook (1933, 1938), Dora Colebrook (1935), King (1930) and others. Not only is this type of infection more deadly to the individual patient but as often as not it attacks the woman who has had a normal spontaneous delivery and among recently delivered women it appears to have a degree of contagiousness comparable only to that of small-pox. A great advance in recent years has been the clear demonstration that this organism is practically never present in the birth canal before labour but is conveyed from without and usually by droplet or spray infection from the nose or throat of one or more of those in attendance at the delivery or during the puerperium not excluding the patient herself. The danger is greatest when any of those concerned is actually suffering or has recently suffered from some infection of the nose or throat. After recovery a small proportion estimated at about 7 per cent. in general but probably nearer 20 per cent. during seasons when colds and sore throats are rife continue to be carriers of haemolytic streptococci but there seems to be evidence that in such circumstances the organisms are not so virulent and the risk of their infecting a patient although by no means absent appears to be definitely less serious (Murray, 1930). In medicine as in warfare each newly discovered method of attack is quickly countered by a new method of defence and in this case the defence is twofold: first the use of masks to cover the mouth and nose of all in attendance and secondly the tracing of the cause of the infection by bacteriological examination of the throat and nose of each person who has been in close contact with the patient and if possible the exclusion from obstetric work until after recovery of any person found to be a probable source of the puerperal infection.

One final preliminary statement is that in the last two years there have been two cases in England in which a patient who went into a small maternity hospital or home for her delivery and there contracted puerperal infection has successfully claimed damages from the hospital authorities or doctor concerned because of alleged lack of reasonable care against infection.

It is these recent advances in our knowledge of the nature of the attack and of the means of defence together with the disturbing situation created by the legal actions mentioned which make this subject so suitable for discussion at a time when the State is placing on local authorities an increasing responsibility in regard to midwifery.

Value of Ante-natal Supervision

In trying to lay before you a brief consideration of the points which obstetricians in general regard as important in the prevention and control of this disease I would stress in the first place the value of ante-natal supervision. It must be interpreted in its widest sense and its aim in this connexion must be to build up the patient's resistance. The general health of the patient should be assessed as early as possible during pregnancy and treatment directed to any faults. I have had the opportunity of studying some hundreds of maternal death schedules through the courtesy of Dr. Charlotte Douglas of the Department

* Read in opening a discussion at a joint meeting of the Sections of Obstetrics and Gynæcology and Public Health and Hygiene at the Annual Meeting of the British Medical Association, Plymouth, 1938.

of Health for Scotland and this has impressed upon me the lamentable number of cases of death from puerperal infection in which pregnancy should never have been allowed to occur because coexistent conditions of disease and debility made these women unfit to resist the infection which ultimately destroyed them. Here we impinge upon vast and complex economic and social problems, questions of self-control and birth control, possibly even the vexed question of the law in regard to abortion, which I have no time to discuss.

Apart from attention to general health and any special indications of disease, the antenatal prevention of puerperal infection involves the treatment of septic foci in the body—for example, teeth, tonsils, sores and the cervix uteri. The very real danger of marital intercourse in the later months of pregnancy should be explained to the patient and, if need be, to her husband.

Diet

After this comes the important question of diet. In general it is quality rather than quantity that is at fault, and the ultimate cure is education in the elements of dietetics. Vitamins are greatly in vogue at the present time and there is probably no profession more susceptible to the dictates of fashion than our own. That vitamins, particularly A, B, C, D and E, are essential may be accepted as an axiom, but in patients who are on a reasonably good mixed diet it is probably unnecessary to administer supplementary vitamin preparations. If every pregnant woman would include fresh fruit in her daily diet and add to the fruit fresh green vegetables, dairy produce, and fresh herrings, the needs of the situation would be fully met and incidentally some of our economic difficulties ameliorated. In addition to vitamins the mineral elements of the diet are of great importance as the growth of the foetus makes real demands in respect of these substances which must be supplied from the mother's diet if her own tissues are not to be depleted to an extent which may undermine her powers of resistance. But here again a reasonable mixed diet should suffice, and it is only in cases where a deficiency of, for example, iron is clinically detected that direct medication is desirable.*

The more strictly obstetrical side of antenatal care is preventive in an important degree. By foreseeing causes of danger and difficulty, steps can be taken to ensure a method of delivery calculated to minimize trauma and haemorrhage, to control toxaemia, and to eliminate the risks inevitably associated with delivery in unsuitable surroundings.

The Place of Delivery

This brings me to the question of the *locus* of the delivery where circumstances offer a choice. I see no objection to delivery in the patient's own home provided it is suitable, and provided that the patient is in good general health and that no obstetrical operation of any gravity is likely to be required, but only medical considerations, and not sentiment, should determine the choice. Unless the patient's own home is clean and airy, and she can have a bed and preferably a room to herself, it is not a suitable place for a confinement. Far too many women are still delivered in wholly unsuitable houses and if there is no hospital accommodation for them then we must press for its provision. Other essentials are that sterile outfits of dressings, etc., must be provided either by the patient or by the local authority. Furthermore the danger of contact with members of the household newly returned from infectious diseases hospitals or with running ears or infected throats or sores must be kept clearly in mind and the presence of any such risk should determine removal to hospital. Any comparison of the relative safety of delivery at home and in hospital or a maternity home involves the assumption that in the latter the conditions and the technique are good. This point was made by the judge in one of the legal cases mentioned. In the past most hospital reports have shown a lower general mortality rate in the outdoor cases than *in the indoor cases* and the obvious explanation is that difficult and complicated cases naturally gravitate to the hospitals and so weight their figures adversely. The comparison is therefore fallacious as the two groups of cases are not strictly comparable. What more concerns us to-day is that evidence is accumulating that so far as infection is concerned the statistics of hospitals in which careful bacteriological control is exercised are beginning to show a lower incidence of infection in hospital than in district practice (Colebrook 1938, Rose 1937). I am therefore in favour of institutional midwifery except where the domiciliary conditions regarded from the obstetrical standpoint are really good and in my view fortunately, the social trend in favour of institutional midwifery will probably continue despite any opinions to the contrary.

It therefore behoves us to see to it that all maternity hospitals and homes conform to the high standard in accommodation, personnel and technique which their existence is now legally taken to imply. Overcrowding is too common even in some of our famous hospitals. Accommodation should be available for the complete separation from the very outset of clean and of suspect cases—that is cases which have been examined or handled outside—and for the immediate segregation of all puerperae who present symptoms suggestive of infection. Recognized cases of infection should be transferred at once to an entirely separate unit or a special hospital. In the design of new hospitals these points should be insisted upon as primary essentials.

Maternity Institutions

Maternity homes should be inspected more frequently and more searchingly than has often been the case hitherto by a responsible official of the local authority who has a real practical knowledge of midwifery. Much of the so called inspection at present is merely a formal compliance with the letter of the law.

In every maternity hospital and home one individual should be charged with the ultimate responsibility for distribution of patients to the various wards and the notification to doctors in charge of patients as well as to the local authority of all cases of puerperal pyrexia or infection. In the larger hospitals this should be the resident obstetrical officer, in the smaller hospitals and nursing homes the matron.

Another question arises in regard to the admission of cases of puerperal infection to maternity institutions. Unless a whole separate block is reserved for such cases this seems to me quite wrong. Again, if such cases are housed in a separate block, or in a hospital for infectious diseases, it seems desirable that they should be under the supervision of an obstetrician. This recommendation is not intended as a reflection on the competence of the staff of such hospitals but as a plea for increasing the experience of the obstetrician in a particularly important type

* In connexion with diet in relation to the prevention of puerperal sepsis the interim reports of the unfinished investigations of the Joint Council of Midwifery are most suggestive. See *Public Health* April and November 1937 and March 1938.

of case to which he is often called in consultant What of abortions which are almost always suspect ? Should they be sent to a maternity hospital to a gynaecological ward or to a special ward connected with a maternity hospital? The last seems to me the best plan for again and even more emphatically these cases should always be under the care of an obstetrician

Intra natal Technique

Intra natal technique is the most important point of all for it is during labour that the danger is at its maximum The simple main requirements are a clean vulva clean hands clean dressings clean instruments and the prevention of the contamination of any of these clean things during the labour The attainment of these desiderata means safety anything short of it spells danger A completely aseptic technique is even more unattainable in midwifery than in surgery and there are those who recognizing this rely wholly upon the lavish use of antiseptics and produce fine results in support of their policy But I think the better and more rational plan is to combine both methods—to render aseptic by boiling everything that can be boiled and to apply adequate antiseptic methods to those that cannot Thus gloves gowns sheets dressings and instruments can and should be sterilized the skin of the hands and of the vulva can be rendered reasonably safe by thorough antiseptic treatment

I cannot here enter upon the relative merits of the many antiseptics in use For information upon that point and indeed upon this whole subject I would refer you to the invaluable work of Dr Leonard Colebrook (1938) I would only emphasize that the strict routine observance of a careful technique is much more important than the particular antiseptic used The one essential is that the antiseptic should be used in a strength sufficient to be really and rapidly germicidal Let me rather give you an outline of the technique which we follow in the Royal Maternity Hospital Edinburgh and which I put forward not dogmatically but just as an example

1 At the outset of labour the patient's whole body should be thoroughly washed if time and her general condition permit *In hospital* this is done by a spray bath with the woman sitting on a stool or lying on a slab to prevent the possible entry of soiled water into the gaping vulva of a multipara In the absence of such facilities a bed bath or in an emergency a thorough washing of the lower abdomen vulva and thighs, must suffice

2 The vulva and pubes are shaved again well washed with soap and water and dried Thereafter a soap and water enema is given unless the patient is bleeding or is advanced in labour and after the rectum has been evacuated the whole area is treated with 5 per cent dettol as a lotion or in the form of 30 per cent dettol cream

3 Before any examination and in any case always at the end of the second stage dettol lotion or cream is again applied We more often use dettol blue—that is dettol with an inert pigment—for the skin as it clearly shows the limits of the area treated

4 Before examining or delivering the obstetrician washes his hands thoroughly with warm running water and soap rinses them in methylated spirit dons a sterile cap mask and long sleeved gown and sterile gloves Dettol cream is used as a lubricant for the fingers and for such instruments as the forceps If running water is not available care must be taken that the basins used have been sterilized and the water itself should be boiled wherever there is any dubiety about it

5 The vagina is not treated antiseptically except in the presence of a leucorrhoeal discharge in which case it is douched out with 5 per cent dettol solution immediately before delivery

6 After delivery the vulva buttocks and thighs are swabbed clean with 5 per cent dettol and a sterile gamgee pad applied

Obviously such a technique is not applicable in detail in many of the houses of the poor but given he provision *of a sterile outfit by the local authority something* closely approximating to it is usually possible I would draw attention to L Colebrook's (1938) evidence that dry hands or dry unsterilized gloves can be rendered sterile and even actively antiseptic by rubbing pure dettol or 30 per cent dettol cream into them until they are dry In an emergency this is an invaluable hint

I anticipate that the question of masks will arise in this discussion but if the importance of spray or droplet infection *from the mouth or nose of an infected attendant* or even a healthy carrier upon hands dressings and instruments or upon the vulva itself is admitted then it seems to me that the wearing of a mask is the obvious and inescapable common sense preventive measure The only alternative to a mask is to conduct the labour in absolute silence but an unexpected and irresistible cough or sneeze may betray even the most devout Trappist Moreover the mask to be adequate must consist of *at least* four folds of fine meshed gauze and must itself have been sterilized Many of the masks in use are more figuratively than literally of the nature of lip service to the doctrine enunciated

With this technique the further endeavour to prevent infection during labour lies in the observance of the principles of good midwifery in the conduct of the case in particular in the avoidance of trauma haemorrhage and exhaustion Unnecessary interference is certainly to be deprecated but unnecessary delay is also undesirable and the obstetrician who has conscientiously observed the precautions mentioned need not fear to undertake any minor intervention such as a low forceps operation Major forms of intervention especially those involving the introduction of the hand into the uterus must always remain more dangerous and will always carry some toll of subsequent infection Whenever possible they should be carried out in a hospital where the surroundings the facilities and the number of assistants are more suitable

The Puerperium

In the early days of the puerperium similar precautions must be maintained for there is abundant evidence that some women become infected a day or two after delivery The main principle is again the prevention of infection from the hands nose and throat of the nurse or others attending the patient and to this must now be added the prevention of contagion air borne or otherwise from one patient to another Before giving any attention to the genital area the nurse must scrub her hands and forearms and should don a mask and sterile gloves In hospitals and nursing homes each patient should as far as possible have her own individual outfit and equipment and where this is impossible all articles should be sterilized before use In particular does this apply to bed pans The importance of fresh air and sunshine and the promotion of drainage of the uterus by propping the patient into a sitting position at frequent intervals after the first twenty four hours need only be mentioned

The sphere of drugs in the prophylaxis of infection in the puerperium has received attention from time to time *Quinine* for example has long had a vague but rather unsubstantiated reputation in this respect and in combination with ergot is widely used The recent introduction of sulphanilamide preparations and their striking

success in the therapeutic treatment of streptococcal infections naturally raised the question whether their administration would be correspondingly successful in prophylaxis To test this my colleagues and I in the Royal Maternity Hospital Edinburgh (Johnstone 1938) made a rough-and-ready clinical experiment on a large scale by giving a prophylactic course of these drugs to every patient delivered in the hospital during the year 1937 A comparison of the results of the year's working with those of the previous year showed a reduction in the number of puerperia which were morbid according to the B M A standard from 3·06 per cent in 1936 to 1·9 per cent in 1937 In order to test the real significance of this apparent improvement we are this year using all sulphanilamide drugs only as therapeutic agents in cases of pyrexia in which infection is suspected and the further comparison of our 1938 figures with the two previous years may prove interesting In the meantime I hesitate to make what may prove to be exaggerated claims for the prophylactic use of these drugs although in our experience their administration was apparently beneficial and was seldom if ever, associated with any detriment

Control of Infection

I pass now to the question of the control of infection In the first place a chart of the morning and evening temperature and pulse should be kept during every puerperium and the nurse should make a daily note of the state of the lochia and of any abnormal symptoms Any rise of temperature to 100° F after the first twenty-four hours should be regarded with suspicion and if it recurs within the next twenty-four hours without some obvious extragenital reason the patient if in a hospital or nursing home should be removed forthwith to the segregation room or department This is no counsel of perfection but a most reasonable precaution A high vaginal swab may be taken with advantage and sent to a competent bacteriologist preferably one who has the means of grouping streptococci Here I would interpolate that in our experience the ante partum taking of vaginal swabs has not proved helpful and the general conclusion is that such streptococci as may be found occasionally in the vagina before labour rarely cause serious infection after it I do not deprecate the procedure, but I do not regard it as part of the essential technique, which I am trying to keep down to its simple elements

After segregation of the patient the next step—and one of particular importance in hospitals and maternity homes where infection is for obvious reasons most apt to become epidemic—is the bacteriological investigation of the nose and throat in all contacts with the patient who has developed infection The logical sequel to this is when at all possible the temporary exclusion from obstetrical work of any persons found to be 'carrying' haemolytic streptococci and the segregation of any other patients in the same ward who are harbouring these organisms Here again I would make an interpolation Where there are no symptoms referable to these organisms, the preliminary swabbing of the throat and nose of those about to engage in maternity work, as well as the routine swabbing of those already engaged in it seems to me unnecessary provided a technique such as I have described is conscientiously observed Admittedly the omission of this step falls short of the full and rigid application of our present bacteriological knowledge, but I submit that the full application of that knowledge might well lead us into positions so impracticable as almost to paralyse the work of our hospitals as well as of the single-handed country practitioner Lyons (1936) of Boston has estimated that in winter when infections of the air-passages are common the exclusion of all carriers of haemolytic streptococci—that is of healthy carriers as well as those with recognizable infections—would reduce the staff of a hospital by 30 per cent I believe that even the bacteriologists recognize the impracticability of this situation Moreover if routine test swabbing is to be done how often is it to be done? If fortnightly why not weekly? If weekly, why not daily?

It should however be a rule in every maternity hospital or home that any nurse or ward servant suffering from a sore throat or even from a cold should report that fact to the matron who should arrange for the prompt taking of swabs for bacteriological examination and for relieving such a person from duty in the labour room or puerperal wards until she has recovered and has had two swabs negative to haemolytic streptococci The same principles should be observed by all doctors engaged in midwifery Where these precautions cannot be carried out without grave dislocation of the work to be done—as for example in hospitals with limited staffs or in single-handed practice in country districts—precautions against droplet infection should be intensified and rigidly observed

Air-borne Infection

One last risk deserves consideration—namely air-borne infection A few years ago most of us would have belittled the serious suggestion of such a possibility but recently the work of Cruickshank (1935) W F and M W Wells (1936) and Daryl Hirt (1937) has shown us that the air in rooms occupied by infected patients contains multitudes of virulent organisms This is possibly the explanation of some epidemic outbreaks of sepsis in small hospitals and maternity homes which have no adequate means of segregating infected cases as well as of some sporadic cases in domiciliary practice Incidentally it may also possibly have been the explanation of the infection in the two recent cases in which the patients sued for and were awarded damages In both of these instances a claim case was put into a ward in which there was another patient who had a high temperature and other symptoms which were strongly suggestive of puerperal infection and who ought therefore to have been segregated Personally I do not think we can escape the conclusion that such a procedure does constitute a lack of reasonable precautions in an important respect

These two cases are profoundly important because they introduce an element of the fear of the law into ordinary midwifery practice but we must not allow ourselves to exaggerate the position No sane judge would allow damages against a doctor or an institution simply because the plaintiff had contracted puerperal infection He would require to be satisfied that in some essential point or points there had been a breach in the observance of reasonable precautions At the same time one successful claim is apt to encourage others and we must protect ourselves against vexatious actions The doctor who signs a certificate of insanity or who treats a fracture without having recourse to radiographs does so nowadays at some risk to his peace of mind and his pocket We must not allow any similar paralysing apprehension to enter the field of obstetric practice for lack of a clear statement as to what in the present state of our knowledge, are the simple and reasonable essentials of the proper conduct of a midwifery case And if such a state

ment cannot be derived from a discussion such as this then we may possibly have to look to the Ministry of Health or to some equally authoritative source to frame one

PREVENTION OF PUERPERAL SEPSIS*

BY

ETHEL CASSIE M D D P H

Senior Assistant Medical Officer of Health (Maternity and Child Welfare) Birmingham

No excuse is needed for the detailed consideration of a subject like puerperal sepsis where slight carelessness or even too great enthusiasm on the part of the nursing or medical personnel for remaining on duty may result in tragedy

The Modern View of Puerperal Infection

It is of great interest to notice the complete change of attitude since the war regarding the causes of the condition This shows more clearly than any other fact the progress that has been made and gives us increasing hope for the future When the Public Health Act 1936 officially eliminated the term puerperal fever the end of an epoch was indicated The very points I have been asked to discuss to day emphasize the general acceptance of the modern view of puerperal infection We are no longer content to consider the possibility of infection in relation to the delivery alone It is recognized that during the ante natal period certain definite precautions should be taken

A good deal of stress is laid by some authorities on the importance of dental care It is obvious that a clean mouth is a first step in personal hygiene and the provision of dental treatment in connexion with ante natal clinics is now recognized to be not only advisable but necessary During 1937 8 974 women received treatment at the child welfare dental clinics in Birmingham The majority or about 60 per cent, were sent from the ante natal clinics and represent roughly 50 per cent of those attending the clinics This does not give a complete picture of the need for there is still a good deal of prejudice against dental care The provision of cheap dentures does much to encourage the removal of decayed teeth however and actually 968 women were supplied with dentures in 1937 At the City Maternity Homes the women are so anxious to obtain admission that they submit to having dental care whenever the medical officer considers it necessary this being a condition of admission

The careful examination of every woman suffering from a vaginal discharge with an inspection of the cervix is an essential step in the preventive side of ante natal care and the treatment required must be insisted on The possibility of throat and sinus infections must be remembered also

On the educational side while the preparation of the delivery room is asked for by every district midwife instruction should also be given to report the occurrence of any infective condition in the family not forgetting the child with impetigo or otorrhoea Such conditions should of course receive immediate attention Health talks at ante natal clinics should include information on such points

Ante-natal Care

There is also the very important question of building up resistance It is obvious that an anaemic and badly nourished woman will have a poor chance of recovery if she should be infected and she is more liable to infection A complete system of ante natal care should include the provision of a satisfactory diet Milk alone is obviously not enough although it is so valuable a food The supply of meals in necessitous cases meets the need to some extent but in the *worst* cases only In the diet of a large proportion of working class women iron calcium and vitamins are primarily deficient and these can be supplied as useful supplements

Ante natal care plays its full part in the prevention of sepsis only when every effort is made to obviate malpresentations and disproportions causing difficulties at labour The importance of early induction of labour or of Caesarean section in suitable cases should not be overlooked in this connexion The association of toxaemia and ante partum haemorrhage with sepsis is universally recognized It is not possible to deal successfully with toxaemia outside an institution and ante partum haemorrhage however slight, also requires full investigation Sepsis often follows where repeated small haemorrhages have been allowed to occur

An obvious step is the provision of sterile dressings for district midwifery The maternity packet is now very generally available but it is not yet very generally used I should like to see such sterile dressings supplied in every case and the cost included in the midwife's fee Meanwhile the careful instruction of the expectant mother in the proper preparations for the delivery is essential The supply of drums of sterile dressings to every midwife rather than the use of sterile packets involves a prohibitive cost for transport as well as a high original expenditure but some such provision for emergencies is advisable

The development of ante natal care has proceeded very rapidly during the last ten years and the general standard is constantly rising but even yet there is too little appreciation of the amount of actual ill health requiring investigation and treatment in an institution properly equipped for such work such investigations moreover require to be guided by the physician rather than by the surgeon for pregnancy furnishes more medical than surgical problems

The ante natal clinics must be used to assist the district midwives but there need be no failure in co-operation with general practitioners or hospitals if there is sufficient understanding and good will on both sides

The Spread of Infection

The spread of infection by the midwife or doctor in puerperal sepsis is now more often due to direct infection

* Read in opening a discussion at a joint meeting of the Sections of Public Health and Hygiene and Obstetrics and Gynaecology at the Annual Meeting of the British Medical Association Plymouth 1938

as in early throat, nose, and ear conditions than to dirty instruments or neglect of personal hygiene It is the attendant in the early stages of a sore throat, where there is little more than malaise to suggest danger or again one who has not sufficiently recovered from such a condition who most frequently appears to be responsible for normal labours becoming septic Where inquiries are made, such infections are often found to have been present or for that matter a husband or child may be the origin of the infection though in such cases there is less opportunity for direct contagion Naturally with increased manipulation the possibility of infection is greater

It is essential that the midwife and doctor should regard their own state of health as an important factor and those with any septic condition however mild should feel themselves bound to avoid midwifery Even where some condition like otitis media or a chronic antrum appears completely quiescent there is danger, for with fatigue and strain the infecting organisms reappear This may be observed for instance in the case of a midwife so affected two or three notifications of puerperal pyrexia in her practice will be associated with a rush of work and a discharging ear or a painful sinus Suspension for weeks follows with apparent recovery and after some months the same incidents recur The danger of a healthy individual becoming a carrier for a short time cannot be overlooked

The need for a high standard of personal hygiene is now so clearly understood that it need hardly be referred to, but those responsible for housing midwives should remember that a bathroom is as necessary as a kitchen and that facilities for sterilization of bowls, instruments, etc, are essential A brief summary of the instructions issued to Birmingham City midwives may be of interest, and is available

The Midwifery Service in Birmingham

One of the essentials of a midwifery service is the provision of sufficient relief midwives It is necessary to arrange that the relief midwife does not come into contact with her sick colleague a precaution that is easily forgotten The wearing of masks by midwives, whether acting as maternity nurses or midwives, is now practically universal in Birmingham—only a few independent midwives are not using them The city midwives wear gowns with masks attached The patients raise no objections, and the measure of protection afforded is considered well worth while

With regard to institutional care I should like to mention the very good record established at two of our maternity homes The larger of the two homes with 847 deliveries in 1937, had only thirteen cases of notifiable pyrexia and no case of puerperal sepsis, the second home with 518 deliveries, had not a single case of notifiable pyrexia These are genuine records, and most careful supervision is exercised to see that no rise of temperature is overlooked The aseptic technique employed in these homes has justified itself As regards the methods used I should like to draw attention to a few points

All attendants are gowned and masked throughout all contact whatever with the patient Dettol and flavine are the chief antiseptics used Boiled bed-pans are employed on every occasion, and a second bed-pan is provided for swabbing A gown for the use of the nurse when giving bed-pans and swabbings hangs at each bed Masks are of fourfold gauze with paper between folds, and on removal they are placed in antiseptic lotion Fresh sterile masks are available at the entrance to all wards All bedding is disinfected after each case, as well as beds lockers etc All wards are washed down after each batch of patients Ward floors are never swept, but are polished and kept clean with damp mops to avoid raising dust Nurses do not sort dirty linen which is immediately removed from the vicinity of the wards

Time does not permit of other details but I might add that each patient is provided with a paper bag to hold dirty handkerchiefs etc and that only husbands are allowed to visit No nurse or doctor with the slightest cold or sore throat is permitted to enter the wards If anything the smaller home has observed a more stringent antiseptic technique and this has been justified by the result

Throat and Nose Swabs

The nurses are not accepted at these institutions without a preliminary medical examination and they are all general trained nurses At one time a throat swab was taken and if a haemolytic streptococcus was found the applicant was rejected but the percentage of rejections was so high that this had to be abandoned It must be understood that no typing was carried out Swabbing would only be done at the institution in the presence of several cases of pyrexia and so has not been found necessary in the maternity homes

With regard to throat and nose swabs in district practice it is advisable to take these where several cases of puerperal pyrexia have been notified in a midwife's practice The swabs are almost inevitably positive to the haemolytic streptococcus and it is then necessary to suspend the midwife till two negative swabs are obtained which may mean weeks off duty Typing may help here but when not available attention paid to the throat and nose and the usual holiday in the country undoubtedly benefit the midwife's health Bacteriologists appear to vary in their findings and it is sometimes helpful to try a second expert when the period of off duty is too prolonged Without typing swabs give only a vague indication of the source of infection but in an outbreak with one common attendant swabs are worth while and offer some measure of protection

Notification of Pyrexia

On the occurrence of puerperal pyrexia it is the midwife's duty to send for medical help at once She must then notify the supervising authority through the midwives supervisor that she has been "in contact with a person whether or not a patient suffering from puerperal fever or any other condition which may raise suspicion of infection" in the words of Rule 9

The medical practitioner often misunderstands the situation He considers the pyrexia is not yet notifiable and he mistakenly instructs the midwife that there is no need to inform the supervisor There is, as a matter of fact no connexion the one is a question of keeping the rules of the Central Midwives Board, and the other is a notification No midwife can notify puerperal pyrexia, but having been in contact with it she is bound to obey the rule Our own practice is to instruct the midwife to inform the doctor that she will not be allowed in the ordinary course to continue on the case, and to request him to call in the district nurse whose fee will be met by the local authority Only under very exceptional circumstances would the midwife be permitted to continue in attendance She would then attend no other case

A further safeguard in relation to midwives and spread of infection is the enforcement of a rule that the practising district midwife must not attend miscarriages owing

to the frequency of sepsis in these cases As a matter of fact they seldom would for as a rule they have not been booked so early in pregnancy but there is some danger that the midwife might be called in by a doctor The district nurse is obviously the right person and there appears to be no reason why she should not be used

The District Nurse Midwife

Rural areas are frequently served by a district nurse midwife This is in my opinion a bad practice and is no longer needed with the sufficient use of motor cars and telephones Where distances are too great for this it is surely the duty of the local authority to provide institutional care and a home help service Rural local authorities are too often content to throw up their hands and talk only of the difficulties of long distances meanwhile making no effort to meet them There is also a great tendency to say countrywomen will not accept this and that when they are given no chance to say they will As a matter of fact the patience and long suffering of the rural population are wonderful but are wearing rather thin

Provision for Emergency Cases

The situation in a maternity institution admitting emergencies is often very difficult and there is undoubtedly a higher sepsis rate in such institutions than there would be if the accommodation was of a higher standard

Separate delivery rooms and separate wards with ample single room isolation are essential for satisfactory work with emergencies but are seldom or never available Frequently the institution tries to do more than it has accommodation for and so lowers the general standard No maternity institution moreover can afford to be without isolation rooms for the potentially septic cases and these should be provided even where arrangements are made for the immediate removal of every case of notifiable pyrexia

Conclusion

I would like to emphasize that the prevention of puerperal sepsis depends on intensive and intelligent antenatal care with precautions directed towards safeguarding the patient from infection carried by the attendants both during and after delivery The greatest danger lies in the patient being infected through the attendant's own failure in health and the best safeguard is the building up of the patient's resistance by proper nutrition and the early and efficient treatment of all toxic or debilitating conditions as well as by intelligent anticipation and treatment of obstetric abnormalities At the same time the most stringent precautions should be taken in relation to asepsis dust infection etc since all the ordinary risks of wound infection are constantly present

The results of a careful technique show that institutional care can be rendered free from risks other than those inseparable from midwifery The situation is very different where proper care is not exercised

I should like to add a plea for closer co operation with the public health authorities on the part of general practitioners Notification of puerperal pyrexia is not a meaningless formality it helps to ensure efficient supervision of midwives and gives information of the utmost interest in assessing the value of various precautionary and preventive measures

The present statistics of puerperal pyrexia are valueless for district practice they are fallacious since a very large number of cases are never notified

THE PREVENTION AND CONTROL OF PUERPERAL SEPSIS ADMINISTRATIVE ASPECTS*

BY

A MASSEY, M D, D P H

Medical Officer of Health City of Coventry

Extent and Nature of the Problem

The Report on an Investigation into Maternal Mortality published by the Ministry of Health last year contains interesting figures relating to the role of sepsis in the causation of puerperal mortality In this connexion for example it is shown that in a series of 770 maternal deaths investigated in selected areas puerperal sepsis was deemed to have been the cause in no less than 39 per cent of cases In the country generally it appears that 30 per cent to 40 per cent of all maternal deaths are attributable to sepsis For the year 1937 in England and Wales the maternal mortality rate was 3 11 per 1 000 total births the rate for puerperal sepsis being 0 94 Although figures relating to maternal morbidity are not available it is safe to assume that sepsis is similarly a dominant factor in causation

Maternal Mortality for the Year 1937 in Certain Towns

Town	Maternal Mortality per 1 000 Total Births	From Sepsis	From Other Causes
Barrow in Furness	4 90	0 95	3 95
Bolton	6 10	0 87	5 23
Bootle	3 66	1 83	1 83
Bournemouth	2 85	0 71	2 14
Bristol	3 53	1 12	2 41
Coventry	3 06	0 30	2 76
Darlington	1 68	0 84	0 84
Derby	4 65	1 39	3 27
Dundee	5 12	1 92	3 20
Eastbourne	4 69	1 56	3 13
Edinburgh	4 55	1 17	3 38
Liverpool	2 31	0 58	1 73
Middlesbrough	4 59	1 77	2 82
Stoke-on Trent	4 59	0 84	3 75
Sunderland	3 45	1 06	2 39
Walsall	4 04	2 02	2 02

These considerations underline at the outset the first importance of measures directed to the prevention and control of puerperal sepsis It must be confessed however that hitherto these measures have been attended with but limited success It is notorious that in contrast with a spectacular reduction in infantile mortality little or no impression has been made upon the maternal mortality rate Maternal deaths due to sepsis have in fact increased to some extent in recent years The measures of social economic and environmental amelioration that have lowered the infantile death rate in so marked a fashion have hitherto proved of much less avail against maternal mortality Some investigators indeed, have adduced findings to indicate that the incidence of puerperal sepsis actually tends to increase on ascent of the social

* Read in opening a discussion at a joint meeting of the Sections of Public Health and Hygiene and Obstetrics and Gynæcology at the Annual Meeting of the British Medical Association Plymouth 1938

scale But there are many complex factors here at work, such as, to take a single example, the larger proportion of first confinements among the more well to do classes

Improved standards of general midwifery practice are admitted to constitute the basis of measures for the prevention and control of puerperal sepsis To attain these standards is not entirely a matter of obstetrics but partly also a matter of administration The administrator can do much to raise the standard of skill and method in midwives practice and to improve the conditions under which obstetricians and midwives work and also the human material with which they have to deal To the administrator also falls the task of evolving policy notably, for example, in connexion with the relative claims of institutional and domiciliary midwifery with the conduct of ante natal centres with the enforcement of notification of puerperal pyrexia and like matters Then again—and this is all-important—he is concerned with the education of public opinion on behalf of maternal welfare I will deal briefly with some of these points

Standard of Midwives' Practice

Although the proportion of confinements attended by doctors and midwives respectively varies somewhat widely area by area, it is probable that in the country as a whole some 70 per cent are attended by midwives alone In accordance with the modern trend of thought moreover, it is likely that a still larger proportion of normal confinements will be undertaken by midwives in future Thus it is that in the prevention of puerperal sepsis no measure is more important than that of raising the standard of midwives practice This at once indicates the supreme rationale of the Midwives Act, 1936 which has for its primary objects the improved education and status of midwives, the elimination of unsuitable persons from midwifery practice, and the competent control and supervision of midwives remaining in public or private practice

The schemes of full-time salaried midwives for domiciliary practice now being operated under the 1936 Act by local authorities or by approved voluntary associations under the surveillance of local authorities, have attracted to their service the best of available personnel in the various localities Increasing numbers of residual private practising midwives are capitulating to the lure of compensation as offered them by the Act and under the stress of decreasing practice due to the competition of official services This in time will tend to produce a better type of midwife, under improved control, and should devolve advantageously in the combat with puerperal sepsis Administratively the full time salaried midwife has many advantages relevant to the present theme Important among these is the fact that, unlike her colleague in private practice she has no financial inducement to avoid suspension from duty following contact with infection

An interdiction by local authorities and voluntary associations concerned, in respect of the continuation in their service of midwives after marriage, may well be a necessary measure against puerperal sepsis, for when she has young children of her own, with their liability to scarlet fever, otitis, sore throat, and the like, the married midwife is more than ordinarily liable to convey infection This does not, of course, apply to midwives of middle age, or beyond who were already long married when initially admitted to the service

The Part of the General Practitioner

The increasing tendency for normal confinements to be conducted by midwives restricts the experience in this branch available to medical practitioners, who are nevertheless expected to be equal to all emergencies to which they are summoned by midwives In this connexion it is of course recognized that unskilled or untimely interference is a common cause of puerperal sepsis These and similar considerations have led to the advocacy in some quarters of panels limited to doctors with special experience in midwifery for dealing with midwives emergency cases instead of the present system whereby all medical practitioners are eligible for the work

Notification by medical practitioners of cases of infectious disease is recognized as a necessary condition of control This applies to puerperal pyrexia no less than to other infectious diseases and yet in many areas the notifications of puerperal pyrexia are notoriously incomplete As a result of the Public Health Act 1936 the procedure in regard to the notification of puerperal febrile conditions has been simplified Formerly, for purposes of notification it was necessary to categorize these conditions into either puerperal fever or puerperal pyrexia The effect of the new legislation is that the previous administrative differentiation between puerperal fever and puerperal pyrexia is removed and all puerperal febrile states are notifiable as puerperal pyrexia A more complete system of notification of this condition by medical practitioners is a necessary and ready line of reform in connexion with the control of sepsis

Institutional v. Domiciliary Midwifery

In recent years there has been a progressive increase in the hospitalization of maternity cases The Midwives Act, 1936 may now serve in some degree to check this tendency for one of its objects appears to be that of restoring domiciliary confinements to greater favour This has a bearing upon the prevention and control of sepsis although it is difficult to define or assess In most areas the increasing public demand for institutional confinements has overtaxed available beds and either in overcrowding of cases or a diminution of the routine length of stay in hospital has resulted In this way the risks of puerperal sepsis have been increased Thus it appears that a necessary measure is either substantially to increase maternity bed accommodation or to limit admissions The latter may well be the right as well as the readier line to take, notably in view of the improved domiciliary midwifery services already available as a result of the 1936 Act

Cases for institutional maternity beds might usefully be restricted to (*a*) those showing abnormality as revealed at ante natal investigation, (*b*) primiparae and (*c*) cases from unsatisfactory homes Thus the maternity hospital would deal largely with such types of case as constitute the worst "risk" in connexion with the possible supervention of puerperal sepsis Then again, the admission of emergency cases of potential sepsis has to be considered

These things indicate that the careful planning of accommodation in maternity hospitals and in maternity units attached to general hospitals is a measure of fundamental importance in the prevention and control of puerperal sepsis For this purpose separate isolation blocks are desirable for the accommodation of (*a*) cases of sepsis occurring in the routine practice of the hospital or unit, and (*b*) emergency admissions of actual or possible sepsis In too many maternity hospitals or units the lay out of accommodation is such that difficulty arises in circumscribing infection Nowadays it may well be more important to have ample isolation accommodation for cases of puerperal sepsis than to have small pox hospitals

With regard to the hazard of puerperal sepsis there is some division of views as to whether a maternity hospital

is better as a separate entity or as a unit attached to a general hospital The latter gives greater economy of administration and it is likely that any epidemiological risk that may attach to the arrangement as such can be obviated by proper planning of the unit and by careful internal administration of the hospital

Laboratory Facilities

In controlling puerperal sepsis a combination of epidemiological and bacteriological investigation is usually necessary as for example in the determination of carriers and other agencies of infection It should be just as much a matter of routine practice systematically to investigate an occurrence of puerperal sepsis as it already is in the case of the other major infections Appropriate administrative action—in connexion with maternity hospitals in the suspension of midwives from duty and like matters—depends very often upon bacteriological findings From the administrative point of view therefore adequate laboratory facilities are of obvious importance and should be made available wherever possible in each area In regard to laboratory services in general there is useful scope in many districts in the matter of joint laboratory schemes conducted by the local authority and the local voluntary hospital in partnership

Nutrition of Expectant Mothers

In the attempt to promote in expectant mothers a resistance to infection attention to the nutritional state is clearly of importance For this purpose general powers for the care of mothers are contained in Section 204 of the 1936 Public Health Act This section replaces that part of the 1918 Maternity and Child Welfare Act which dealt with the promotion of maternal health It appears that the word care now introduced is capable of the widest interpretation Most or all maternity and child welfare authorities include in their schemes arrangements for the supply to expectant mothers of liquid milk or dried milk at cost part-cost or free according to the ascertained means in each case In a few areas the schemes also embrace milk meals or dinners for necessitous cases The milk meal consists of milk and bread and butter, and is usually served about 11 a m The dinner is a complete meal produced usually in a municipal kitchen and served at midday To ensure that the expectant mothers themselves actually receive the meals the latter need to be served at prescribed centres under supervision Such measures as these have relevance—indirect but important—in the general combat with puerperal sepsis

Formation of Public Opinion

Public or private agencies working on behalf of maternal welfare cannot achieve the best results without the active co operation of the individuals whom they seek to help The expectant mother herself may often be the final arbiter on the question of whether or not her confinement is to escape contingencies In order to induce her to seek adequate ante natal care and to follow faithfully the advice she receives popular education in these matters is necessary This comes largely within the province of the health administrator although the family practitioner can take a vital part as an educator within the limits of his practice

Medico legal Aspects

In connexion with puerperal sepsis it is important to say a word concerning the liabilities and responsibilities of those in administrative charge of maternity hospitals or domiciliary midwifery services and of those in clinical charge of maternity cases I shall be brief however because a later speaker is to deal with this matter specifically The Lindsey County Council v Marshall case which was carried to an appeal in the House of Lords in 1936 threw much light on the subject notably in so far as concerns responsibility for the conduct of maternity hospitals and concerning the respective liabilities of local authorities and their medical officers

The present position appears to be that any medical practitioner—whether in public or private practice—performing clinical work in the conduct of maternity cases is personally liable for all that flows from his (or her) acts or omissions On the other hand where a medical officer is performing an administrative act or a ministerial act as required by some statute or order of a governing or employing authority the latter would be the defendant or would be joined as a defendant In short it appears that the clinical practitioner stands alone in this matter whereas the administrative medical officer has his employing body behind him Despite the foregoing however there are borderline cases in this connexion which fully tax the legal judgment

In the Lindsey County Council v Marshall case the appeal of the local authority in question was dismissed, and the main grounds for the decision appear to have been that the focal point in the case was an administrative one—namely that at the time the plaintiff was admitted to it the maternity home administered by the county council was not reasonably safe by reason of the prior presence of a case of puerperal sepsis about which the plaintiff was not informed

The responsibility of a local authority or other governing body in connexion with a maternity home appears to be to satisfy itself so far as possible as to (*a*) the suitability and safety of the accommodation provided (*b*) the supply of proper food (*c*) the adequacy of the equipment and (*d*) the reasonable efficiency of the staff it employs The last two points also apply in the case of a domiciliary service of midwives

Conclusion

The part prescribed for me in this discussion has relation to the administrative aspect only and I trust that I have kept the bounds of my allotted sphere The subject under consideration is complex and wide and in respect of omissions I must plead the set limits of time and space

---

The Minister of Health on July 26 opened a new general hospital at Louth Lincolnshire The hospital was formerly a Public Assistance institution which has been converted by the erection of a large ward and alterations to the existing building at a cost of about £71 500 It has accommodation for 200 beds The public health hospitals should co operate with and not rival the voluntary hospitals said Dr Elliot Indeed this principle of consultation is a statutory requirement of the Local Government Act of 1929" He described the great change that had come in the status of the old Poor Law hospitals with the passing of the Local Government Act of 1929 which empowered local councils to appropriate individual institutions to the public health services This process expunged the so-called stigma of the Poor Law and set up a new hospital service of great national importance He noted with approval that in the Lindsey area of Lincolnshire a consultative committee had been set up representative of the voluntary hospitals and the county council which did excellent work in co ordinating the hospital services as a whole

PREVENTION AND CONTROL OF PUERPERAL SEPSIS BACTERIOLOGICAL ASPECTS*

BY

R. M. FRY, M.R.C.S.

Assistant Director of the Bernhard Baron Research Laboratories, Queen Charlotte's Maternity Hospital, London

Under the name of puerperal sepsis we have to include bacterial diseases due to a number of different infecting organisms and dissimilar both clinically and in the manner in which the infection is spread. The organisms concerned in the more severe forms of puerperal sepsis are fortunately few in number. They are:

(i) Haemolytic streptococcus (Lancefield's Group A). Haemolytic streptococci belonging to Groups B, C, and G are much less common, and the infections caused by them are seldom severe.

(ii) Anaerobic streptococci.

(iii) *Bacillus coli*.

(iv) Staphylococcus.

(v) *Bacillus welchii* and other spore-bearing anaerobic bacilli.

(vi) Pneumococcus.

For purposes of prevention and control of sepsis a knowledge of the common sources of the infecting organisms is of more importance than knowledge of the clinical features of the disease.

Two Groups of Organisms

The organisms enumerated above fall into two clearly defined groups. The first group with which I shall deal first in order to dismiss it contains the anaerobic streptococci, *B. coli* and *B. welchii*. These organisms are all normally present in or near the genital tract—the anaerobic streptococci in the vagina, and *B. coli* and *B. welchii* in the faeces and therefore probably contaminating the skin of the perineum. The explanation why such infections are not more common appears to lie in the fact that these three organisms do not multiply readily in normal lochia or serum, but their growth is favoured by the presence of necrotic tissue such as may be found when there has been severe trauma or when fragments of placenta or membranes have been retained. The passage of the organisms into the uterus is of course facilitated by the introduction of hands or instruments into the uterus. The influence of injury or interference on such infections is shown by figures from Queen Charlotte's Hospital Isolation Block. During the four years 1933 to 1936, out of thirty-eight consecutive cases of anaerobic streptococcus septicaemia only four had normal labours without severe trauma or interference such as manual removal of the placenta or self-induced abortion. This is in striking contrast to the haemolytic streptococcus septicaemias during the same four years, when, out of eighty consecutive cases, no fewer than forty-four followed normal delivery with no interference or trauma.

These figures, with similar ones which can be obtained, on a smaller number of cases, for the *B. coli* and *B. welchii* infections, clearly support the view that infections by these organisms are mainly those of complicated obstetrics, and I would suggest that the control of such infections lies more in the hand of the obstetrician than of the bacteriologist. I do not propose to go into the free question of antiseptic technique from the bacteriological point of view. From the medico-legal aspect it is doubtful if infections by these three organisms are of much importance. They do not appear to be commonly transmitted from patient to patient, and in any case proof of such transmission would be hard to obtain in view of the frequency with which they are normally found in or near the genital tract.

In infections due to the other group of organisms—the haemolytic streptococcus, the staphylococcus, and the pneumococcus—we are faced with a very different problem. I propose to deal with the haemolytic streptococcus alone first. It was shown by Lancefield and Hare in 1935 that in a series of 555 vaginal swabs taken from normal women at the time of labour no haemolytic streptococci belonging to Lancefield's Group A were seen. There is as yet no record of these organisms being found in the normal vaginal swab before delivery. It is an interesting fact that of the patients at Queen Charlotte's isolation block infected with the haemolytic streptococcus about 90 per cent. have negative vaginal swabs before discharge from hospital and almost all are negative within a month after discharge. This suggests that the normal genital tract is not a favourable situation for the survival of the haemolytic streptococcus Group A.

In the absence of evidence to the contrary we are justified in assuming that these infections are introduced from some extragenital source. That this is often the case has been shown by the researches of J. Smith and of Dora Colebrook, both of whom found streptococci serologically identical with those infecting the patient in some extragenital source in the patient or attendant in about 75 per cent. of cases examined.

We have then as one of the fundamental principles in the investigation of haemolytic streptococcus infections, to face the fact that practically all are introduced from some extragenital source during labour or in the early days of the puerperium. There are two other important facts which I shall give in the form of figures taken from the records of Queen Charlotte's Isolation Block for the seven years 1931 to 1937. These are (1) of all cases of puerperal pyrexia admitted only 33 per cent. were infected with the haemolytic streptococcus; (2) of all *fatal* cases of puerperal sepsis 70 per cent. were haemolytic streptococcus infections.

Sources of Haemolytic Streptococcus Infections

If we consider the chief possible sources of haemolytic streptococcus infections we find the following three broad groups:

1. Infections from the respiratory tract or rarely some other septic focus, of an attendant or other contact.
2. Infections from the respiratory tract, or some other septic focus, of the patient herself.
3. Infections transmitted from another septic case by attendants, dressings, instruments, or dust.

How may such infections be prevented? I feel strongly that it is only through close co-operation between the obstetrician and the bacteriologist that success can be achieved. If I appear to stress the importance of bacteriological investigation too much it is for two reasons: first that as a bacteriologist I am naturally biased; and secondly, that the two recent well-known cases in which legal action has been taken and heavy damages have been awarded have shown so clearly the dangers of neglecting

* Read in opening a discussion at a joint meeting of the Sections of Obstetrics and Gynaecology and Public Health and Hygiene at the Annual Meeting of the British Medical Association, Plymouth, 1938.

to make such investigations The point for consideration then is to decide what measures to take in order to avoid doing too little on the one hand or on the other hand trying to do too much so that the whole matter of bacteriological investigation becomes impracticable and absurd

Infection from Contacts

In the first of the three groups mentioned above we have infections from attendants or other contacts It is clearly too much to attempt frequent routine examinations of all nurses and doctors engaged in midwifery practice and it is extremely doubtful if any valuable results would be achieved by such measures On the other hand it is essential to take swabs from the nose and throat when there are any symptoms suggesting respiratory tract infection or any history of a recent infection of this kind This should in my opinion apply not only to medical attendants but to any member of the patient's family who is likely to be in the house at or near the time of delivery Not only is respiratory tract infection to be watched for but also any septic focus on the skin and in children especially any aural discharge I would suggest too as a reasonable precaution that a throat swab should be taken from any nurse before she starts maternity work especially if she has been recently engaged in general medical or surgical nursing At Queen Charlotte's Hospital all new nurses and resident medical officers have throat and nose swabs taken before they start their duties

Infection from an Extragenital Source in the Patient

In the second group—that of the infections from the respiratory tract or other focus of the patient herself—we are on more difficult ground It is probably neither necessary nor wise to swab the throats of all patients as a routine but when there is any history suggestive of recent respiratory tract infection this should certainly be done This affords protection for the patient for if the swab be positive special precautions can be taken such as the wearing of a mask by the patient and the sterilization of her hands by dettol cream It is in such cases too that the prophylactic use of sulphanilamide at the beginning of labour might be expected to be of use The doctor may also receive some protection for if the patient should develop puerperal fever no claim for damages would be likely to succeed if there were definite evidence that she had haemolytic streptococci in the throat before delivery

Infection Transmitted from Patient to Patient

In the third group we are faced with the problem of what must be done when a patient develops puerperal sepsis to safeguard the other patients First a vaginal swab must be taken and examined as soon as possible I would emphasize this apparently obvious point particularly because there is a tendency at the present time to swab the throats of all attendants and take no steps to find out the nature of the patient's infection Since it is only in haemolytic streptococcus infections of the patient that the question of infection from the throats of attendants arises and since only about one third of the cases of puerperal sepsis are due to that organism this practice is to say the least irrational While waiting for the report on the vaginal swab the patient must, of course be regarded as a suspect case and be strictly isolated and those in attendance should not attend clean cases If the swab is found to be positive for the haemolytic streptococcus then and then only is it necessary to investigate contacts Apart from this investigation of contacts *efficient* sterilization of the room and everything it contains must be carried out before admission of another case—another obvious point which is sometimes overlooked It is not always recognized that the haemolytic streptococcus can survive in a dried form in dust for a long time This was conclusively demonstrated in 1936 by White who showed that the dust of single bedded rooms in which patients infected with the haemolytic streptococcus were nursed was always infected with that organism She also showed that a human infection could be caused by infected dust and that the streptococci could live in the dust for as long as ten weeks

Throat Carriers

The question naturally arises as to what is to be done with nurses who are found to be throat carriers of haemolytic streptococci In my opinion there is only one possible answer—that they must be kept away from maternity work until negative In view of the natural variations that occur in the amount of growth from a swab two consecutive negative results should be obtained before return to duty is permitted There are I know those who hold different opinions from this who believe that haemolytic streptococci in the throat are of no importance if the throat is clinically normal This view has the advantage of putting the onus on the clinician presumably a laryngologist instead of on the bacteriologist but the dangers from the medico legal point of view must be great It is difficult to imagine the line of defence in an action for damages where it was known that a nurse present at a delivery was a carrier even if a healthy one of haemolytic streptococci

Co-operation between Clinician and Bacteriologist

Finally, I must deal with the question of co operation between clinician and bacteriologist Speed is essential in all these investigations and in order to help the bacteriologist a definite request for an examination for the presence of haemolytic streptococci should be made instead of the usual vague request for bacteriological examination or even more briefly ? orgs It must be remembered that a complete bacteriological examination of a swab from the throat or vagina may take many days a provisional report on the presence or absence of haemolytic streptococci can however nearly always be given in the morning after the day on which the swab is received and the bacteriologist must be prepared to help by giving such provisional reports by telephone If grouping of any streptococci found is to be done a further twenty four hours will be required but the number of cases infected by groups other than Group A is so small that a provisional report of haemolytic streptococci present in large numbers is sufficient evidence on which to take all necessary steps of isolation specific treatment and examinations for the source of infection I may mention here that the haemolytic streptococcus in the vaginal swab in puerperal sepsis is nearly always present in overwhelming numbers or is absent so that there is seldom much doubt as to the nature of the infection

Commentary

It may appear that I have laid great stress on the haemolytic streptococcus infections There are three reasons for this First as already mentioned they are responsible for the majority of fatal cases, secondly they

are the infections in which we know that the organism is introduced from an extragenital source and in which, therefore the possibility of spread from attendants or from patient to patient has to be considered, and thirdly they are the infections for which we have now a specific method of treatment in sulphanilamide and its derivatives so that early diagnosis is important for the patient herself as well as for others who may run the risk of infection transmitted from the same source

From the bacteriological point of view then, the issue is clear We have first to investigate every case of puerperal pyrexia by taking a swab from the vagina (a cervical or intra-uterine swab is not necessary) and examining primarily for haemolytic streptococci May I interpolate at this point my belief that there is no substitute for this examination and that evidence gained from the clinical state of the patient can never give an accurate answer to the all-important question Is this a haemolytic streptococcus infection? Having received a positive report on the swab steps must be taken to find the source of infection, both in the patient herself and in attendants and other contacts The finding of a source in the patient is of little use in preventing the spread to others as she will in any case be isolated but from a medico-legal point of view it may be of use as a line of defence If the vaginal swab is negative for the haemolytic streptococcus no investigation of contacts is necessary since other infections, with the possible exception of the very rare staphylococcal and pneumococcal ones are not generally transmitted from an outside source

This much is clear, but the problem still remains of how to get the necessary examinations carried out quickly and accurately There can be few places in this country that are not within easy reach, by post at least, of a laboratory, but because of the necessity for speed it is essential that the laboratory should contain at least one full-time experienced bacteriologist If haemolytic streptococci are to be "grouped"—and this is important, especially in examination of throat swabs, to avoid suspending nurses unnecessarily—the difficulty is greater still, as the number of laboratories in which this can be done is still small At the Research Laboratories at Queen Charlotte's Hospital we attempted to fill this gap by instituting a service for the examination of any swabs from maternity cases or their contacts for haemolytic streptococci only, and for the grouping of any such organisms found If a few more laboratories would undertake similar work in some of the large towns throughout the country so that practitioners resident anywhere in England could be sure of obtaining accurate cheap, and, above all, quick reports, there would no longer be any excuse for attempting to solve the problems of a bacterial disease by clinical data alone

---

Standard specifications for protective clothing respirators, gloves and other articles of personal safety equipment may result from a meeting called recently at the request of the National Safety First Association and the Associated Slate Quarries The meeting was attended by both makers and users of safety equipment as well as by representatives from employers organizations engineering institutions trade unions voluntary associations and Government departments A resolution was carried asking the General Council of the British Standards Institution to set up a representative industry committee to deal with all personal safety equipment There are already B S I committees dealing with individual articles of safety equipment such as boots and goggles The proposed industry committee would take over control of these committees and would also deal with any future requests for the standardization of personal safety equipment

TREATMENT OF UNDULANT FEVER WITH PRONTOSIL

BY

CHARLES ZAHRA NEUMANN, M.D.

The remedies which it has been proposed to use for the treatment of undulant fever are so numerous and varied that the natural conclusion is that few or none are really consistent in their action Vaccines so far have proved of limited use except in a few cases where they were injected intravenously and where the curative effect may be ascribed to shock therapy In my experience the results of vaccines with few exceptions have been disappointing The severe and uncontrollable reactions accompanying intravenous vaccine therapy militate against the general acceptance of this form of treatment

When trypaflavine was introduced great hopes were entertained and good results were claimed Certainly some patients recovered fairly rapidly after the dye but in others no result was forthcoming The same may be said of mercurochrome Both these drugs are relatively toxic and their direct introduction into the blood stream increases any potential danger I have used fouadin a trivalent antimony preparation in a few cases but the number is as yet too small to arrive at any conclusion Good results have been reported by Manson Bahr and by Young

A great desideratum would be an effective remedy that could be administered orally and that did not exert any undue toxic action If the claims put forward in the cases described below are confirmed then prontosil and its congeners would be ideal remedies in undulant fever

Cases Treated by Injection

In Cases 17 to 20 prontosil was administered intramuscularly, the dosage being one injection of 5 c.cm on alternate days The urine was stained red within a few minutes, which showed that the excretion was very rapid With the dosage adopted, concentration of the drug in the blood was not likely to be high enough to influence the disease, and in three cases the results were disappointing The first of these (Case 17) was that of a youth aged 18, as soon as his Widal reaction proved positive in a titre of 1 in 150 he was given a *melitensis* vaccine every third day in gradually increasing amounts After three weeks he still ran a high fever and I decided to inject prontosil He was given 5 c.cm every other day for another three weeks At the end of one and a half months of persistent treatment the patient was still feverish and suffering from rheumatic pains The other two (Cases 18 and 19) young children 3 and 4 years old, failed to respond after more than three weeks treatment by prontosil injections The fourth case (No 20) was that of a boy of 6 During the first week of his illness his temperature was as high as 104° F, the blood-serum reaction was strongly positive to *Br. melitensis* and he was then treated with intramuscular prontosil injections on alternate days, at the third injection the temperature was 100° F in the evening, and he was completely afebrile on the tenth day of treatment No second wave of pyrexia occurred, although the patient was kept under observation for six months

It will be realized that in three of these cases the results were meagre, while in the fourth the normal

duration of the disease seemed to have been materially curtailed In the light of further experience with prontosil by mouth it is probable that the dosage administered intramuscularly was too small

Oral Treatment

In all sixteen patients were treated with prontosil red orally they were mostly children and the results in the majority were gratifying It must be premised that none of the patients was severely intoxicated and that the average duration of symptoms at the beginning of treatment was a week to ten days In all a strongly positive Widal reaction to *Br melitensis* was obtained The initial dosage for children was four tablets of prontosil daily Youths and adults received six tablets After three or four days according to the gravity of the case and its response to treatment the number of tablets was reduced to three in the case of children and to four or five tablets in adults Usually at the end of a week children were given two tablets and adults three tablets daily and this was continued for a few days *It is advisable to give the drug for several days after* the patient has become afebrile

Children sometimes dislike the red colour of the tablets and it is a good plan to powder these and to mix them with some jam or marmalade which is then spread on a cream cracker Alternatively one can use prontosil album The effect of the drug on the temperature is usually prompt and a daily fall of 1 F may be expected In some cases prontosil acts in an almost specific manner while in others a minority the effect is disappointing If no result is evident within a week the drug will be ineffective even after prolonged administration Why there should be this variation in individual cases cannot be explained

If given early in the course of the disease a great deal of the debility caused by the long duration of the fever is avoided and the patient can often return to school or to work within two or three weeks after treatment has been started It must be remembered that the disability period of undulant fever averages two to six months

No severe toxic effects were observed after the administration of prontosil In a few cases a curious lassitude perhaps more correctly an abnormally quiet attitude was noticed This began about two days after the first dose and lasted for two or three days Anorexia is usually asserted to be one of the toxic sequelae of the drug but as this symptom is very common in undulant fever and does not become worse after taking prontosil little importance need be attached to it In three cases slight vomiting occurred during the treatment and in one case strangury both these symptoms disappeared in a day or two when the dose was diminished In two cases a slight degree of cyanosis of the cheeks was seen In no case was there any ground for alarm and although the dose was with advantage reduced the drug was never entirely suspended

It is important to continue the treatment for a few days after the fever has disappeared In two cases where this was neglected the pyrexia reappeared but it was promptly vanished when prontosil was again given

Analysis of Cases

Most of the patients were treated in the acute stage of the disease and more experience in the chronic cases of undulant fever would be desirable

Case 1—A child aged 4 had been feverish for over a month when first seen His evening temperature oscillated between 101 and 102 F His general condition was good and he was usually active enough to play with his brothers He was given four prontosil tablets daily for four days the number being then reduced to two in the twenty four hours On the third day after the onset of treatment the evening temperature was 99 F on the fifth day it was normal and has remained so ever since There were no rheumatic pains so common a complication of undulant fever

Case 2—A young man aged 28 was seen after four or five days of high fever His blood serum reaction was strongly positive to *Br melitensis* His general condition was fair but occasionally at night he was restless and his mind wandered He was given six tablets of prontosil daily On the second day the temperature had dropped from 104 to 102 5 F By the fourth day the patient said that he felt much better and the temperature was barely 100 F On the sixth day the patient was normal and the prontosil was stopped Two days later the temperature suddenly rose to 102 F whereupon the drug was again administered with the result that within two days the fever disappeared completely and the patient has been free from it since No rheumatic pains or other complications marred an otherwise uneventful convalescence

Cases 3 4 6 7 and 8—These patients varied in age between 3 and 6 years In all the blood serum reaction was positive to *Br melitensis* and the spleen palpable Four tablets were given daily in jam this was reduced to three and subsequently two tablets as the condition of the patients improved None of the cases was seriously intoxicated and recovery was prompt In Case 4 slight cyanosis of the cheeks was observed on the third day this disappeared on reducing the number of tablets to one daily

Case 5—A young man aged 25 had been ill for three months and the fever had lately been oscillating between 100 and 102 F., with apyrexial periods lasting for a week or ten days He complained of rheumatic pains about the ankles and the knees and had lost weight considerably for which his severe anorexia was mainly responsible The spleen was palpable and the blood reacted strongly to *Br melitensis* The usual dosage of prontosil red was prescribed—that is six tablets daily After five days the patient was free from fever His rheumatic pains persisted for a week and no further then gradually disappeared Although he was kept under constant observation for three months no further wave of pyrexia were recorded

Cases 9 10 11 12 and 13—These consisted of children the youngest of which was barely 3 years old and the eldest 10 The latter as well as Case 10—a girl of 7 years old—was given six tablets for three days and four tablets subsequently The average evening temperature among this group varied between 102 and 104 F In a few days the fever chart showed a definite response to the drug and in ten days all the cases were apyrexial In all the first was also the last wave of fever No relapses were observed during the three months of observation

Case 14—A child aged 5 years was afebrile after a week of treatment and to prevent possible toxic effects prontosil was suspended When three days had elapsed the patient developed a slight evening temperature which rose to 102 F the next day Four tablets of the drug were given for a further five days although the temperature had dropped to normal after the second day of treatment

Case 15—A woman of 70 had been suffering from malaise and generally increasing pyrexia for over a week when a Widal reaction confirmed the suspicion that she had undulant fever When prontosil was prescribed she was in poor condition her temperature was 104 F there was a certain amount of bronchial catarrh and traces of albumin were found in her urine with a few hyaline casts In five days the evening temperature fell to 100 F., and on the seventh day she was free from fever for the first time Her general condition improved considerably in the next few days until a severe sciatica developed which lasted for two weeks

during which period there was no fever She was comparatively well for a month when pyelitis set in with eventual heart failure and uraemia

Case 16—A boy aged 12 was diagnosed as suffering from undulant fever and this was confirmed by the positive blood serum reaction His temperature at the beginning of treatment was 104° F and he had a considerable amount of bronchial catarrh this improved with an expectorant and with poultices but the fever remained high and was still 103° F on the evening of the tenth day although he had been given six tablets of prontosil red daily This was now suspended as albuminuria and casts appeared in the urine and it was feared that prontosil, if not the actual cause might still further accentuate the renal condition After a month the boy gradually improved and his appetite returned Albumin disappeared but tachycardia set in during convalescence This condition is fairly common during convalescence it rarely leads to any serious results, but usually persists for two or three weeks Occasionally there would be a rise to 100° or 101° F for three or four days and then an apyrexial period of a week or ten days The total duration of the fever in this case was a little over two months

Table giving Results of Treatment

Case No	Age (years)	Sex	Dosage	Duration of Fever	No of Waves	Remarks
			Intramuscular Injections of Prontosil			
17	18	M	14 inj of 5 c.cm each	2 months	5	Had previous vaccine treatment (intramuscularly)
18	3	M	6 inj	1 month	2	Had previous vaccine treatment (intramuscularly)
19	4	M	8 inj	3 weeks	2	
20	6	M	5 inj	10 days	1	
			Prontosil Red given Orally			
1	4	M	4 tablets daily	6 days	1	
2	28	M	6 tablets daily	10	2	Prontosil suspended at end of fifth day Had a second wave lasting two days
3	6	M	4 tablets daily	8 „	1	Vomiting from second to fourth day
4	5	F		12 „	1	Cyanosis of cheeks on third day
5	25	M	6 tablets daily	5 „		A chronic case—no other waves after the first week
6	5½	F	4 tablets daily	5 „	1	
7	3	F		2 „	1	Vomiting from second to fifth day
8	6	M		6 „	1	
9	4	M		8	1	
10	7	F	6 tablets at first 4 tablets afterwards	10 „	1	Vomiting from third to fifth day
11	10	M		7 „	1	
12	3	M	4 tablets daily	10 „	1	Strangury on fourth day
13	10	F	6 tablets at first then 4 tablets daily	10	1	
14	5	F	4 tablets daily	12 „	2	
15	70	F	6 tablets daily	7 „	1	Died 14 months from end of treatment
16	12	M		2 months	5	Prontosil suspended after ten days

Summary and Conclusion

1 Twenty cases of undulant fever treated with prontosil are reviewed

2 In four the drug was administered by intramuscular injections on alternate days In only one of these cases was the period of the disease perceptibly shortened

3 In the remaining sixteen cases oral administration was carried out In fifteen of them the average duration of the fever was seven days ranging from two to twelve days In one case the drug was apparently ineffective As a rule cases which are untreated become fever free in two to six months, though considerable variations are met with

4 None of the cases was seriously intoxicated, though some had high temperatures

5 Because of the limited number of cases definite conclusions cannot as yet be drawn, but these results make further research desirable

6 Prontosil red and other oral sulphanilamide preparations so far represent the most convenient treatment for undulant fever and if the results described here be confirmed these drugs may eventually find a valuable place in the fight against this crippling and long drawn out disease

Malta May 5, 1938

A COMPARATIVE TEST OF NATURAL AND CONCENTRATED ANTITOXIN IN TREATMENT OF MALIGNANT DIPHTHERIA

BY

B. A. PETERS, M.D., D.P.H

Medical Superintendent Ham Green Hospital and Sanatorium near Bristol Lecturer in Fevers University of Bristol

Owing to the convenience of its administration the use of concentrated diphtheria antitoxin containing only the globulin fraction of the serum of the immunized horse, is probably universal The serum manufacturers claim that by depriving it of all its inert protein and other useless constituents it is less toxic to human beings, and they continue to offer more and more concentrated antitoxins at higher prices Since the appearance of malignant diphtheria in Bristol in 1921 there have been a few cases in which the administration of antitoxin in large doses intravenously failed to save life, even when the patient was treated within forty eight to fifty six hours of onset of the disease It therefore occurred to me to investigate the relative values of natural (whole serum) antitoxin and concentrated (globulin only) serum to see if in the process of concentration the antitoxin had lost any of its therapeutic efficiency Concentrated serum might still neutralize the same quantity of toxin *in vitro* but it might not have the same avidity for combining with toxin *in vivo* especially as the peptization of the globulin is not so perfect when redissolved after precipitation as it is in the unaltered natural serum This can be demonstrated by examining each microscopically with a dark-ground condenser

The cases chosen for this trial are those which on admission were considered by the admitting medical officer to be so gravely ill as to need a large intravenous injection of antitoxin (usually 30,000 units) and 60 to 100 c.cm of 20 per cent glucose, together with 16 000 units intramuscularly I have included only those cases in which it has been possible to give the full dose of antitoxin and glucose considered necessary sometimes, with a restless patient, the needle has slipped out of the vein before the completion of the injection The cases received natural or concentrated antitoxin alternately

As the number of cases suitable for the test has varied between only 11 and 23 per cent of our total admissions,

it has taken six and a half years to amass the data now analysed Since the material was obtained from two sources over a long period the serum of several horses was used thus eliminating a possible error as the serum of different horses varies in its liability to produce reaction The volume of the natural serum was two to three times that of the concentrated serum The mortality rates and complications observed are given in Tables I and II

hyperpyrexia and symptoms of collapse Temperatures up to 107 F have been recorded in this series These reactions are dangerous unless the temperature per rectum is recorded every ten minutes and the usual measures are taken to deal with hyperpyrexia

Misled by the advertisements of serum makers we were very much surprised to find that these severe reactions occurred in 23 per cent of those treated with concen

	Day of Death from Onset of Disease													Total
	3rd	4th	5th	6th	7th	8th	9th	10th	11th	12th	13th	14th	Over 14	
Controls (concentrated serum)	3	3	5	3	3	1	2	1	5	1	–	–	7	34
Tests (natural serum)	1	3	4	2	2	3	4	5	2	3	2	2	7	40

Mortality Rates

The percentage difference in the two series appears to favour the concentrated serum slightly (18·6 per cent compared with 22·8 per cent) but as the difference is only equal to the standard error it cannot be regarded as statistically significant Therefore the two sera appear equal in life saving properties

Paralyses

In this series I have included only the more serious forms (palate pharynx and diaphragm) as ciliary paralysis is difficult to prove unless the patient is old enough to read The difference here appears in favour of the natural serum but as it is only twice the standard error it is not strictly admissible This is also borne out by the fact that fatal paralysis occurred in four of the control series and five of the test series

Late Serum Rashes

These occurred in 52·7 per cent of the control cases and 34·8 per cent of the test series As the difference here is over three times the standard error it is probably significant

Rigors and Hyperpyrexia

The great disadvantage of giving foreign serum intravenously is the occurrence of severe rigors associated with

trated serum and in only 1·1 per cent of those given whole natural serum although the latter cases received far more foreign protein than the former It was observed that rigors occurred with equal frequency in the patients who recovered and in those who died It was also found that in 50 per cent of the fatal cases treated with concentrated serum death ensued within seven days of the onset of illness but only 30 per cent of those treated with natural serum died so early (Table III) suggesting some immediate toxic effect of the concentrated serum However whole horse serum is probably nearer human plasma in its buffering electrolyte content and the physico-chemical state of its protein than a single protein fraction that has been dehydrated and precipitated The colloid chemist tells us that no lyophilic colloid reverts exactly to its former state after rough handling—the phenomenon they term hysteresis These findings are not applicable to all therapeutic horse sera as we found in attempting to carry out a similar series of observations with streptococcal antitoxin natural and concentrated administered intramuscularly to scarlet fever patients using alternate cases as before but without giving hypertonic glucose simultaneously as we did with the diphtheria antitoxin With both types of streptococcal antitoxin serious and alarming reactions occurred in so high a proportion of cases that we did not feel justified in continuing the trial in such a comparatively benign condition as scarlet fever

Commentary

I do not think that the intravenous glucose is the factor concerned, as in several cases where the patient received only natural diphtheria antitoxin without glucose (not included in this series) no reaction occurred It would therefore appear either that streptococcal antitoxin is more toxic than diphtheria antitoxin on intravenous injection or that the sensitivity of patients to foreign protein differs in the two diseases The time taken for the membrane to separate and the duration of the albuminuria—which latter is an index of persisting toxaemia—were also tabulated, but they showed no significant difference with the two types of sera

As a result of this investigation we have decided in future to use natural diphtheria antitoxin for intravenous injection The smaller bulk of the concentrated serum is still to be preferred for intramuscular injection in the milder cases

Conclusions

When given intravenously with 20 per cent glucose, (1) the therapeutic effects of natural and concentrated diphtheria antitoxin on the death rate and paralytic complications are equal, (2) concentrated antitoxin is twenty times as likely to give severe immediate reactions and one and a half times as likely to give late serum rashes as whole natural antitoxin (3) On this account natural diphtheria antitoxin is to be preferred for intravenous injection (4) These findings are not applicable to streptococcal antitoxin

TREATMENT OF PELLAGRA WITH NICOTINIC ACID

BY

M. RACHMILEWITZ, M.D.

AND

HELEN I. GLUECK, M.D.

(From the Out-patient and Medical Department of the Rothschild Hadassah Hospital Jerusalem)

The work of Elvehjem and his associates (1937) on the treatment of canine black-tongue with nicotinic acid, and the resultant cures, have stimulated clinicians to use this substance in the treatment of human pellagra Fouts and his co-workers (1937) reported four cases treated with nicotinic acid These patients, after having been placed on a control diet poor in the pellagra-preventing factor, were observed for three days During this time their condition remained stationary or became worse Treatment was then begun with nicotinic acid in doses varying from 0 5 gramme to 1 gramme daily Within forty-eight hours after the initiation of the treatment all the patients showed distinct improvement in their general condition and the stomatitis was completely healed In two patients suffering from diarrhoea normal stools were obtained on the third and the fifth day respectively The dermatitis disappeared within six to twenty-five days All the patients noticed warmth and tingling of the skin ten minutes after ingestion of the nicotinic acid

Almost simultaneously Spies, Cooper, and Blankenhorn (1938) reported eleven cases of pellagra placed on basic control diets poor in the pellagra-preventive factor The most striking effects were observed on the glossitis and stomatitis which usually disappeared forty eight hours after the beginning of treatment The pellagrous glossitis, stomatitis, ptyalism urethritis, and proctitis did not reappear while the patients received nicotinic acid In one case the glossitis and stomatitis which had disappeared with the use of nicotinic acid recurred when it was discontinued Mild cases of dermatitis in which the epithelium remained intact blanched within twenty four to forty eight hours after the administration of the drug However severe cases of dermatitis in which the lesions were moist, ulcerated and thickened did not seem to benefit by nicotinic acid In several cases there was flushing of the dermal lesions with tingling of the skin shortly after the administration of the drug These authors conclude that 0 5 gramme daily in five doses of 100 mg each is a safe and effective amount in the usual *case of pellagra*

In a further report Spies (1938) describes fifteen cases similarly studied and treated In these the urine was tested for porphyrin In one case the porphyrin disappeared from the urine forty eight hours after the beginning of treatment, only to reappear when the nicotinic acid was discontinued In a later communication Grant Zschiesche and Spies (1938) again confirmed these observations and pointed out that the healing of the dermatitis was completed by the end of the second week

Smith Ruffin, and Smith (1937) report a chronic case of pellagra with typical dermatitis hyperkeratosis of the face diarrhoea, and mild dementia which responded to nicotinic acid Yudkin Hawksley, and Drummond (1938) report a case which was successfully treated with a 'liver filtrate' factor In a later communication Hawksley (1938) records a case ending in recovery after treatment with nicotinic acid He concludes that the liver filtrate factor used in the previously treated case must contain nicotinic acid

We shall briefly describe two cases of pellagra which were successfully treated with nicotinic acid

Case I

A woman aged 62 was admitted to hospital on April 12, 1938, having previously been observed for eight days in the out patient department Four months before admission she began to complain of severe diarrhoea consisting of four to six foul liquid stools daily The diarrhoea persisted in spite of medication The patient then put herself on a diet of white bread, crackers zwieback rice milled cereal, white cheese, and black coffee Sugar, meat, vegetables, fish, butter, eggs, and milk were rigidly excluded from the diet The patient felt weak and listless and lost considerable weight The diarrhoea persisted One month before admission she noticed that the skin on the dorsum of the hands was rough and scaly The lesion progressed rapidly until the dorsum of the hands became fiery red and scaly At the same time she noticed red circles under the eyes, somewhat similar to the skin of the hands One week before admission she began to complain of burning of the tip of the tongue

Physical Examination—The patient was well orientated and co operative She appeared chronically ill and undernourished The skin of the face was dry atrophied, and wrinkled Under the eyes it was reddened rough, and scaly Around the neck there was a wide band of brown pigmentation *The dorsum of the hands was wrinkled fiery* red, and covered with a scaly dermatitis extending from the nail beds to the wrist There were areas of deep brown pigmenta-

tion at the wrists and the carpo metacarpal articulations There was a moderate pigmentation on the dorsum of the feet The tongue showed some atrophy of the papillae at the margin with reddening of the tip The patellar and Achilles reflexes were somewhat hyperactive but no abnormal reflexes were present Vibratory sense was diminished to the knees as was perception of touch the patient being unable to distinguish between the head and point of a pin There was no pain on pressure on the leg muscles The Romberg sign was absent Motor power appeared normal The rest of the examination produced nothing abnormal

Laboratory Data—The stool contained no parasites or ova The urine was normal The red cells numbered 3 900 000 per c mm and the haemoglobin amounted to 75 per cent Sahli The white cells totalled 7 200 per c mm and the differential count was normal Radiographs of the stomach and duodenum revealed nothing of note The gastric juice showed complete achlorhydria

Clinical Course—The patient was put on a basic diet similar to that of Spies sufficient in protein fat and carbohydrates but deficient in the pellagra preventive factor The dermatitis and diarrhoea became more marked weight loss was rapid and the appetite continued poor On the fourth day after admission while continuing the basic diet she was given two 50 mg doses of nicotinic acid by mouth The amount was then increased to 150 mg daily given orally in three 50 mg. doses until discharge from the hospital On the second day of the treatment there was a slight improvement in the dermatitis with desquamation starting in the central portion of the dermal lesions of the hands The tongue was no longer reddened and the marginal papillae appeared normal The appetite improved considerably On the fourth day of treatment the diarrhoea suddenly ceased and throughout her stay in hospital the patient had one normal stool daily Five days after the beginning of treatment she complained of tingling of the finger tips flushing of the face and dizziness The drug was discontinued for two doses but on the sixth day was continued without untoward effect

By the sixth day of treatment the dermatitis of the hands had disappeared except for a small area of pigmentation at the wrists By the tenth day the skin was entirely normal Since the results of the nicotinic acid had been so striking eggs milk puree of vegetables and chicken were added to the basic diet Her only complaint was weakness of the legs and some difficulty in walking The results of neurological examination made at this time were the same as on admission except that vibratory sense was now normal Because of these symptoms from the fourteenth day the patient was given one ampoule of crystalline vitamin B_1 (betaxin) intramuscularly daily until discharged nine days later At discharge the reflexes were still hyperactive but sensation was completely normal She no longer complained of difficulty in walking or weakness in the legs Her weight in spite of the pronounced general improvement remained constant (44 kg) However this woman was seen in the out patient department ten days later and had gained 3 kg in weight with no treatment other than a normal mixed diet

Case II

The patient a porter aged 46 was first seen in the out patient department ten days before admission to hospital When admitted on April 28 1938 it was impossible to obtain a detailed history from him because of his obvious mental confusion depression and anxiety However a history was elicited at a later period of his illness when his mental condition had greatly improved He had been unemployed for five months and during this interval his diet had consisted entirely of unleavened bread rice potatoes lentils and occasional cabbage or boiled egg plant His appetite had become very poor For three months he had felt extremely weak could no longer lift heavy objects and finally could hardly walk He complained of dizziness and dull aching pains over the entire body One month before admission he first noticed that his hands were becoming fiery red and painful This he attributed to constant exposure to the sun He did not complain of diarrhoea or a sore mouth

Physical Examination—The patient was uncooperative disorientated and appeared badly nourished and severely ill His face looked apathetic and listless The dorsum of the hands was covered with thick scaly hyperkeratotic fiery red dermatitis deeply fissured and ulcerated In some areas there were blotches and brown pigmentation The feet showed a similar but less severe dermatitis The orifices of the sebaceous glands about the nose were plugged with horny concretions The tongue was coated no glossitis or papillary atrophy being present The heart sound were distant and of a tick tack quality Neurological examination revealed absent patellar and Achilles reflexes The abdominal reflexes were present Sensory examination was impossible because of the confused mental condition of the patient The gait was ataxic and swaying with small steps The Romberg sign was absent The rest of the examination was not notable

Laboratory Data—The urine was normal but porphyrin was present on admission There were 3 000 000 red cells per c mm when admitted and 4 100 000 on discharge the haemoglobin was 60 per cent Sahli and the differential count was normal The Wassermann reaction was negative The stools contained no parasites or ova The gastric juice showed complete achlorhydria A radiograph of the stomach revealed severe gastritis with thickening of the rugae A radiograph of the heart did not show any enlargement.

Clinical Course—The patient was put on a basic diet similar to that of Case I His appetite was poor and he refused most of his food He was uncooperative and disorientated and urinated on the floor of the ward On the day of admission treatment was begun with 50 mg. of nicotinic acid The next day he was given two doses of 50 mg each After the second dose the patient complained of severe itching over the areas of dermatitis flushing of the face and faintness An urticarial rash appeared over the knees back and arms this persisted for two hours The drug was discontinued for the third and fourth days Meanwhile his dermatitis and mental state became distinctly worse On the fifth day he was given two doses of 10 mg. each on the sixth day 10 mg eight times on the seventh day 50 mg three times and subsequently 50 mg four times daily until discharge No further reactions to the drug were observed On the seventh day after a total dose of 400 mg. of the drug, the dermatitis showed marked improvement The appetite was very good but the mental condition had not improved By the twelfth day of treatment the dermatitis of the hands had completely disappeared except for a small area of pigmentation at the wrists The skin of the nose was now entirely normal The patient's mental condition had shown marked improvement and he was now rational and co operative and walked about the ward In spite of his basic diet he had gained 1 8 kg in weight By the thirteenth day of treatment he was completely normal mentally and his appetite could no longer be satisfied by the pellagra producing diet He was therefore given a regular diet on the fourteenth day Neurological examination still revealed absent knee and Achilles reflexes but the sensory examination appeared normal The patient was now exposed to the direct sunlight for periods of one and a half hours on several occasions The dermatitis did not recur On the eighteenth day the urine in which porphyrin was found on admission and on the eighth day in hospital no longer contained this substance On discharge on the twenty third day he was in excellent health and had gained 3 kg. in weight

Summary

Two cases of pellagra are reported in which the patients while subsisting on a basic pellagra producing diet, were treated with nicotinic acid Both patients recovered from the disease the first by the ninth and the second by the thirteenth day of treatment The average dose varied from 150 to 200 mg orally a day Both patients had

reactions to the drug early in the treatment In Case II the mental symptoms disappeared with treatment

Clinical Memoranda

Basal Narcosis in the Treatment of Tetanus

Recovery from generalized tetanus of short incubation period is rare enough to justify presentation of this case The remarkably beneficial effects of continuous and intermittent basal narcosis (in this particular patient with nembutal) would seem to suggest that this form of treatment is a most valuable means of combating a dread disease

CASE REPORT

A man aged 28, of robust build, was admitted to St Vincent's Hospital, Dublin, on March 24 1938 presenting the classical signs and symptoms of established generalized tetanus, temperature 101° F, pulse 102, respirations 30 The patient, who was fully conscious stated that he had been in perfect health until March 19, when he developed cramps in his legs and pain and stiffness in his jaw and neck which subsequently spread to all parts of his body He remembered having cut his forearm with a shovel on March 12 while handling animal offal in a factory He did not pay any attention to the cut except to apply iodine As the nature of his illness had not been recognized locally no anti tetanic serum had been given before his admission to hospital

Treatment—The wound in the forearm, which was septic, was freely incised and treated with hydrogen peroxide For the first three days in hospital continuous narcosis was maintained with 7½ grains of nembutal, given intravenously at chosen intervals and during this time continuous intravenous drip glucose saline was administered (10 pints) From the fourth day onwards the nembutal was given by mouth in 4½ grain doses so as to produce intermittent narcosis, which allowed the patient to have adequate nourishment, aperients, and plenty of fluids during the day-time As the patient was rather restless on the fifth day two intravenous injections of the drug were necessary Extending over a ten day period a total dosage of 75 grains of nembutal was given by the intravenous route and of 63 grains by the oral route During the same ten day period 240 000 units of anti-tetanic serum were administered 6,000 units intravenously (under chloroform anaesthesia) 20,000 intravenously, and the remainder by the intramuscular route

Progress—All tetanic spasms had ceased by March 28, temperature and pulse were normal on March 30, but residual stiffness did not show signs of passing off until the tenth day of treatment After this the patient made an uninterrupted recovery

Notwithstanding the large quantity of anti-tetanic serum administered in this case the clinical behaviour of the patient was such as to suggest that the outstanding beneficial agent was the prolonged narcosis produced by the nembutal in conjunction with the intravenous drip therapy

The use of basal narcotics in the treatment of tetanus is of course by no means new Avertin was employed for this purpose by Lawen as far back as 1927 since when there have been frequent references in the literature to the use of various narcotic drugs—chiefly barbiturates This present case is placed on record with a view to emphasizing the value of a method of treatment which is easily applied and which offers a considerable prospect of a successful outcome

Stable Sodium Nitroprusside Solution for Acetone Bodies in Urine

Most of the tests for acetone bodies in the urine are performed by dissolving just before use, a few crystals of sodium nitroprusside in 5 c cm of water and adding a few drops of this solution to the urine containing ammonium sulphate and floating on ammonia This aqueous solution of sodium nitroprusside is very unstable, turning blue when kept for a few hours, so that for practical purposes it has to be freshly prepared every day Unless a large number of urines have to be tested daily much of the sodium nitroprusside is wasted When only one or two urines have to be examined some workers simply place a few crystals—approximately 0·2 gramme—of sodium nitroprusside and a small quantity—about 3 grammes—of ammonium sulphate in a test tube, then add about 5 c cm of the urine direct to the mixed salts and float the ammonia on the top This procedure is also very wasteful of sodium nitroprusside

Sodium nitroprusside is an expensive chemical—over 26s per 500 grammes—and a stable solution would therefore not only be much more convenient for urine testing but would also help to reduce the running costs of the laboratory An aqueous solution of sodium nitroprusside can be rendered quite stable however, merely by the addition of a little concentrated nitric acid, which in no way interferes with the reaction for acetone bodies in the urine This solution will keep indefinitely and so is always ready for use With regard to the ammonium sulphate used in the test it is also more convenient to keep it as a mixed solution with ammonium hydroxide

The reagents for the improved test therefore would be

Solution No I—Ammonium sulphate solution
200 c cm saturated solution of ammonium sulphate,
200 c cm ammonium hydroxide sp gr 0·88

Solution No II—Sodium nitroprusside solution
10 grammes sodium nitroprusside crystals dissolved in
90 c cm distilled water and
1 c cm concentrated nitric acid then added

The Test—To 5 c cm of urine in a test tube add 5 c cm of solution No I and mix Then add 1 c cm of solution No II shake and allow to stand for a minute before judging the colour reaction A deep purple colour will then have appeared if 0·1 per cent or more of acetone bodies is present If only a very faint trace is present the colour will be merely deep red

The saturated solution of ammonium sulphate used in solution No I should be prepared as follows Place 780 grammes of ammonium sulphate in a 2-litre flask and add 1 litre of boiling distilled water Shake immediately until dissolved, then allow to cool at room temperature Decant the supernatant solution (or filter if necessary)

Reviews

A SYSTEM OF MEDICINE AND SURGERY

The Practitioners Library of Medicine and Surgery Volume XIII Supplement Index Supervising Editor Professor George Blumer M D (Pp 1161 184 figures including 4 coloured illustrations £30 for set of thirteen volumes) London and New York D Appleton Century Company 1938

The thirteenth and supplementary volume which contains an index to the whole publication occupying more than a quarter of the volume is an extremely imposing instalment It contains seventy one chapters corresponding to articles in the previous twelve volumes so as to keep the *Library* up to date and this alternative to a loose-leaf arrangement as it saves the reader the trouble of rearranging the pages is more likely to be popular Among the fifty seven contributors thus concerned with more recent advances there are many of the leaders in American medicine to day Professor Henry Christian of the *Peter Bent Brigham Hospital Boston gives an account* of relapsing febrile non suppurative panniculitis (Weber-Christian disease) and thus joins the distinguished band of those such as Paget von Recklinghausen and Osler who have more than one disease as tributes to their clinical activity Professor Warfield T Longcope of the Johns Hopkins University describes with a number of photographs the generalized form of Boeck's sarcoid (maladie de Besnier Boeck or Hutchinson Boeck disease) but has forgotten to give a reference to his own account in 1936 of this interesting disease in which the bones and lungs are affected as well as the skin Dr L G Rowntree late of the Mayo Clinic and now of the Philadelphia Institute for Medical Research gives under the heading of

The Thymus and the Pineal in Health and Disease an account of the remarkable results which he and his colleagues have obtained by experiments on successive generations of animals thus suggesting that these glands have an internal secretion Professor Musser of Tulane University writes on pyocyaneus infection and Professor Blumer of Yale contributes several articles including one on proctalgia fugax a syndrome of unknown aetiology and pathology

This volume is full of interesting material, and attention may be directed to the reviews of recent advances in diseases of the blood forming organs by Dr R Isaacs on the reticulo-endothelial system by Dr C A Doan to Dr Gwathmey's full review of anaesthesia and to that on the sex hormones by Dr Theodore G Klumpp of Yale

WHEN TO OPERATE

Die Anzeige zum Operativen Eingriff By Dr Med Richard Goldhahn (Pp 474 RM 16 50 bound RM 18) Leipzig Georg Thieme 1938

The idea behind this book by Dr R Goldhahn who holds the post of chief medical officer to a municipal hospital in the busy industrial town of Liegnitz, is a good one especially at a time when it is felt in some quarters that surgical technique has come too much into the forefront of surgical practice and is apparently regarded by some as the be all and end all of the work of a surgeon It is easier to operate well than to know when to operate and —what is perhaps more important—when to withhold one's hand and what reactions and complications to expect from a particular operation in short un bon operateur serait quelquefois un mauvais chirurgien.

Dr Goldhahn's textbook is clearly set out in a series of sections arranged on a regional basis and the dark type on dull paper which makes it attractive is clear and easily read There are no illustrations A bibliography immediately precedes the index at the back of the book but although this includes some hundreds of authors references to English and American authorities are very scarce It is annoying to the foreign reader of this work to be confronted with an attempted nationalization of technical terms thus the mediastinum has become Mittelfell the vermiform appendix Wurmfortsatz, and the duodenum Zwolffingerdarm This makes reading unnecessarily difficult for English and American readers We believe that the more international scientific terms become the better for science and for mankind Osler reminded us that in the halcyon days of the Renaissance there was no nationalism in medicine but a fine catholic spirit made great leaders like Vesalius Eustachius Stensen and others at home in every country in Europe The nomenclature in Dr Goldhahn's work is a retrograde step and we hope that a second edition may be corrected in this respect and may also become more representative of what is best in British and American medicine since both the idea and the general form of the book are good

JOHN KEATS

Keats as Doctor and Patient By W Hale White (Pp 96 5 illustrations including frontispiece 5s net) London New York Toronto Oxford University Press 1938

Sir William Hale White has long been known as a lover of Keats He is consulting physician to Guy's Hospital where Keats received his medical education and thus has access to the school registers and he has an expert's knowledge of consumption His little book therefore on *Keats as Doctor and Patient* contains all that is likely to be known about the poet in these relationships During his student career Keats appears as a strong and healthy minded boy taking notes of Sir Astley Cooper's lectures on anatomy and surgery walking long distances for the sheer enjoyment of the exercise and making friends with all and sundry Having obtained the L S A he never practised or put his medical knowledge to any use but turned at once to poetry by which he intended to make a living He was in good health until August 1818 twenty five months after he had left the hospital when he began to complain of toothache and repeated sore throats Sir William Hale-White is careful to explain that these were not, in his opinion due to any tuberculous infection They were evidence of lowered resistance for Keats was working hard at writing and his hygienic surroundings were unsatisfactory His serious illness began on February 3 1820 when he had haemoptysis after a bitterly cold ride from London to Hampstead on the outside of a coach The disease progressed in the usual way and he died in February 1821 little more than 25 years old He caught consumption almost certainly from his dearly-loved brother Tom with whom he lived for months before the disease killed Tom in 1818 Sir William Hale White points out that throughout his illness Keats had the best medical advice obtainable Dr Robert Bree F R S., and Dr William Lambe who both held high office in the Royal College of Physicians and James Clark afterwards Sir James Clark who became physician to the Prince Consort and wrote the article on tuberculous phthisis in the *Cyclopaedia of Practical Medicine* But the fates were against the recovery of Keats nothing was known about the cause of phthisis bleeding was in fashion and fresh air was considered to be dangerous in the sick room.

The book ends with two letters from Keats—one to his publishers the other to Woodhouse—which show that he was not much affected by the malignant reviews in the *Quarterly* and the *Edinburgh* and that they had certainly no effect in hastening or causing his death as has been generally stated Any worry that he felt was associated with his brother Tom's illness, and not with any attack upon himself Lovers of Keats will welcome the book It corrects many errors about him, and explains his illness in the light of modern medicine

OPHTHALMOLOGICAL PRINCIPLES

Introduction to Ophthalmology By Peter C Kronfeld M D (Pp 331 32 figures 15 tables 3 50 dollars) Springfield Illinois and Baltimore, Maryland Charles C Thomas 1938

Dr Peter Kronfeld professor of ophthalmology in the Peiping (Peking) Union Medical College, has written a book out of the usual rut of eye books Instead of a volume that is full of illustrations and blocks of instruments, and not a few coloured prints, there are very few illustrations Instead of a catalogue of diseases with their interpretation and indications for treatment there is an absence of what may be called systematic cataloguing, details of diagnosis are omitted, and there is nothing or next to nothing, about methods of examination and treatment

The book is what might be called a philosophical disquisition on the principles underlying that portion of ophthalmology which is a necessary part of basic medical education It is intended to be read by the student in conjunction with the short and practical courses to which the teaching of ophthalmology has had to be reduced in the curriculum of many medical schools In effect, in this book the professor discusses with his students what he has shown them in the eye clinic He has undoubtedly achieved his aim It is a book calculated to make his students think If it may be taken as a fair average specimen of the teaching that Chinese students receive in the Peking Medical School, then there can be no doubt that the work of that school is on a high level, and will be a credit to medicine and a blessing to the suffering Chinese Paper, print, and binding are perfect

PSYCHOTHERAPY

Concepts and Problems of Psychotherapy By Leland E Hinsie M D (Pp 199, 5 tables 15s net) London W Heinemann (Medical Books), Ltd, New York Columbia University Press 1938

The continual outpouring of works on medical psychology must fill the reviewing staffs of journals with dismay, but now and then a book stands out which is a real pleasure to read because it is likely to be of outstanding value to the profession and to all interested in the subject Professor Hinsie's belongs to this class It is short, simple, and to the point, and gives information which is essentially valuable He reviews the psycho-analytic approach of Freud and the psycho-biological approach of Adolph Meyer, with a brief note on the contributions of Jung and Adler He shows how Freud, dealing principally with psychoneurotics, seeks by researches in the unconscious division of the mind to reorientate the basis of the personality so as to allow the psychoneurotic, with his drive towards adaptation fundamentally unimpaired, to adapt himself to life to better advantage Meyer, on the other hand, dealing principally with psychotics who do not have that drive to adaptation, is concerned almost exclusively with the conscious mind and, while remaining entirely catholic with regard to theories of pathogenesis, seeks to train the patient to become a proper member of the family and of the community by means of his team of psychiatrist, psychiatric nurse, and social worker and a full organization of intellectual interests, occupation, and recreation

Next comes a statistical survey of therapeutic results which imperfect as it necessarily must be, is of the greatest interest It shows that there is no striking difference between the various therapeutic methods, a recovery rate of about 40 per cent being common to them all Psycho analysts, in spite of their claims to superiority, make no better showing than the rest so far as "cures" are concerned and have the disadvantage of the small number of cases with which they are able to deal and the length of time expended on treatment but no one will deny to them the very great service which they have rendered in the elucidation of the pathology of mental disease

A final chapter shows the difficulties and outlines the requirements in attempting a survey of therapeutic results in any department of medicine and especially in mental illness

FOR NOVICE SHIP SURGEONS

The Ship Surgeon's Handbook By Bryce J Macaulay M D (Pp 66 5s 6d net) Bristol John Wright and Sons Ltd, London Simpkin Marshall Ltd 1938

This booklet of sixty-two pages will be found useful in some degree by doctors who wish to join the Mercantile Marine Its small compass a good part of which is taken up with emergency operations has left the author little room for dealing with many points which arise in medical life at sea There is a good introductory chapter in very general terms of a surgeon's duties the details of which differ in the various shipping companies Not enough emphasis is placed on the need for closely supervising the health of the crew, who on arrival in many ports are subjected to personal inspection by the port health officer Nor is the subject of "Radio pratique" instituted in 1937 by the New York Quarantine Board, referred to The responsibility for this pratique lies on the ship surgeon, and, as was seen last year in the case of a German liner, non observance of its demands led to much loss and trouble

The popularity of ocean travel and the large number of steamships with big passenger and crew lists now crossing the Atlantic require more attention than the author has seen fit to give for the guidance of novice surgeons Cases arise which have to be handled differently from those on land The management of mental derangements to forestall jumping overboard, the best method of disinfecting cabins at sea, the isolation of infectious disease contacts, and the medico-legal aspects of accident claims which can involve the shipping companies in great loss if the surgeon has not been careful to observe and note full particulars, are some of the points with which the author has omitted to deal Co operation and consultation with doctors who happen to be on board in serious emergency cases are a special form of medical ethics about which an experienced ship surgeon like the author could helpfully advise those who find themselves in difficult circumstances of the kind that occur at sea Every ship surgeon takes, or should take, with him reference books, and if the space devoted in this small volume to surgical and medical details were given to the points mentioned in this review the book would gain added importance

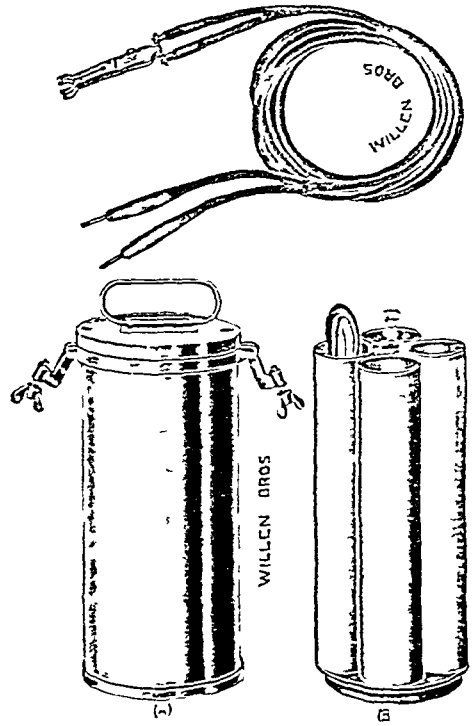
Notes on Books

Within the compass of a single volume of 1234 pages Van Nostrand's *Scientific Encyclopaedia* (London Chapman and Hall 50s.) covers the basic sciences of chemistry physics mineralogy botany astronomy and mathematics the applied sciences of navigation aeronautics and medicine and also engineering. The responsibility for each science rests largely upon a single author the result being a unity otherwise difficult to attain. The inquiring reader will find in the volume much to interest and instruct while the trained technician will by the use of the numerous cross references be able to correlate the information he seeks. Naturally with such a wide range of subjects the length of the articles is restricted but for the most part treatment may be considered adequate. The work is clearly printed and well illustrated.

The Doctor Remembers is a posthumous book by Sir JAMES CRICHTON BROWNE (G. Duckworth and Co. 7s. 6d.). Those who remember the attractive reminiscences and anecdotes of Sir James's long and successful life will turn to this further selection with a sure anticipation of finding a storehouse of interesting events. It was completed shortly before his death in February last but it emphasizes how much he observed with an ever active memory and sense of humour. He had a wide acquaintance especially as the index proves among medical men.

The second edition of Dr. ERWIN RISAK'S excellent little book on Clinical Observation (*Der Klinische Blick*. Vienna: Julius Springer. RM. 8·40 bound RM. 6·30 paper) of which the first edition was published last year has been considerably enlarged by the insertion of new sections on the skull mouth neck thorax abdomen sexual organs and anus as well as by other additions.

Preparations and Appliances



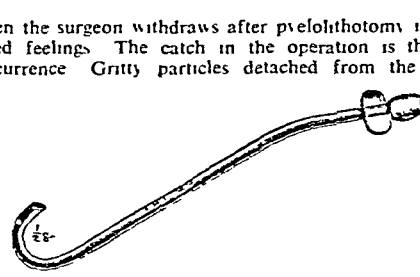
FORMALIN STERILIZER FOR CYSTOSCOPE CABLES

Mr. H. P. WINSBURY WHITE F.R.C.S. (London W.) writes:

The presence of water in some part of the insulating material separating the two pathways which complete the electric circuit from the source of supply to the cystoscopic lamp is one of the commonest causes of a failure of illumination because of short circuiting. For this reason the most practical way of sterilizing those cables which are fabric covered is by means of formalin vapour but this type of cable must be considered unsatisfactory because the fabric may become wet during the cystoscopic examination. Of recent years rubber-covered cables have been in general use but for various reasons certain of them still have the shortcomings of the old fashioned pattern. To be efficient the rubber covering must be reinforced in the weaker places and there must be complete watertight junctions between the cable and the switch and the cable and the battery terminals. Moreover the studs connecting the two plates of the switch should be made entirely of non-conducting material.

There is one pattern on the market which fulfils these requirements and has *withstood the test of two years' use in* my hands including regular sterilization by boiling. I do not doubt that the periods of usefulness of these parts of the cystoscopic armamentarium will be longer if sterilization is effected by formalin vapour. In order to do this conveniently I have devised a formalin sterilizer for endoscopic cables.

The rack has four separate cylindrical compartments (B) of such a size as to take one cable folded in the simplest manner the common floor to the compartments is perforated so as to communicate with a shallow chamber which contains formalin tablets and the floor of which unscrews. The rack lifts in and out of a cylindrical drum (A) the lid of which is kept firmly in position by two thumb screws so as to render the interior airtight. It is easy to remove one cable with the finger without disturbing or even touching any of the others. If it is desired to effect sterilization by boiling after unscrewing the floor of the formalin chamber the rack with its cables can be placed in the sterilizer. Personally I use the appliance as



a storage place for spare cables and I feel that it would be very useful for such a purpose in hospitals as well as to those who use several types of endoscopic instruments and always want to have a spare cable at hand. The cables and the sterilizer can be obtained from Messrs. Willen Bros. 44 New Cavendish Street London W.1.

PYELOTOMY FLUSHING NOZZLE

Mr. A. WILFRID ADAMS M.S. F.R.C.S. (Clifton Bristol) writes:

When the surgeon withdraws after pyelolithotomy it is with mingled feelings. The catch in the operation is the dread of recurrence. Gritty particles detached from the stone(s)

during its extraction may remain behind as a contributory cause of further formations. To reduce this risk an efficient irrigator is wanted. It needs to be long to reach the kidney that resists delivery and the end of the nozzle entering the pyelotomy must recurve so that its jet projects upwards and flushes the vault of the renal pelvis. The small calibre of the instrument should offer no hindrance to the recurrent stream which gushes out of the pyelotomy wound carrying the debris with it. These features are incorporated in the pyelotomy flushing nozzle made for me by Messrs. Down Bros. It is made to fit a Record syringe or small tube and funnel

PREVENTION OF PUERPERAL SEPSIS

No more appropriate subject could have been chosen for discussion at this year's Annual Meeting than the prevention and control of puerperal sepsis The recent achievements in treatment have tended to divert attention from the less spectacular but no less important advances which have been made in knowledge of the causes and mode of spread of the disease The importance of these matters in the administration of maternity homes has been painfully emphasized by recent litigations which have resulted in the award of heavy damages for failure to observe due precautions in treating cases of puerperal pyrexia and in preventing spread of sepsis This subject is of grave concern to every doctor who practises midwifery and the opening papers published elsewhere in this issue will doubtless be read with more than usual interest

Professor R W Johnstone writes from the point of view of the clinician and administrator and his comprehensive and thoughtful paper contains useful suggestions and much sound advice Dr R M Fry contributes a paper on the bacteriology of puerperal sepsis and in a short space gives a clear account of the more important of the recent findings in this field His opinions are based on experience gained as a full-time worker in a hospital dealing exclusively with puerperal sepsis Dr Ethel Cassie and Dr A Massey discuss the problems as they appear to the medical officer of health, and touch on medico-legal matters To readers who wish to pursue this subject further we would specially commend the interesting and scholarly paper on the history of the prevention of puerperal fever by Professor Miles H Phillips [1] and also the article on puerperal infection in relation to midwifery attendants by Messrs J L Miller Wood and F E Camps,[2] together with the subsequent correspondence by Miss Dora Colebrook and others

It is plain that during the last few years much of the confusion regarding the aetiology and mode of spread of puerperal sepsis has been cleared and new facts have come to light which have important bearings on the conduct of midwifery Dr Fry describes two distinct groups of infections one predisposed to by local trauma and presence of devitalized tissues and which is associated with the *B coli B welchii*, or the anaerobic streptococcus This type of sepsis may sometimes cause serious illness but it is not readily conveyed from patient to patient The second type of infection is much more dangerous and is also highly contagious characteristically affecting women who have had 'normal' deliveries as readily as those who have been subjected to obstetrical interference It is caused in the great majority of instances by infection with the "Group A variety of haemolytic streptococci but now and then other forms of haemolytic streptococci, staphylococci or pneumococci are responsible Ample evidence has accumulated to prove that in some 75 per cent of cases the source of this second type of infection is the upper respiratory tract of the attendant midwife doctor, or other "contact" The commonest means by which the organisms are conveyed to the patient would appear to be the fine spray which is unavoidably projected from the mouth on speaking but other less direct means of infection are also important such as the transfer of organisms by fingers which have become contaminated —for example, by use of the handkerchief A nurse or doctor who has recently had tonsillitis or a sinus infection is an obvious danger and must avoid obstetrical work until the throat and nasal secretions are proved to be free from virulent streptococci The issue is clear on this point, but the value of routine swabbing for prophylactic purposes and the attitude to be adopted to the chronic carrier are more complicated questions which are discussed at length in the papers already mentioned and also in an annotation in this *Journal* on July 16 1938 Since no throat can be guaranteed to remain indefinitely in a healthy condition, the use of masks must now be regarded as an essential part of midwifery technique Their use is imperative both during delivery and during the nursing necessary in the puerperium Here it is fitting to quote from Professor Miles Phillips

> "Apart from its use in Caesarean section there has been an astonishing delay in the employment of the face mask in hospitals and, even more so, in domiciliary midwifery practice It is said to reflect that its adoption or more rigid use in this or that institution, on this or that maternity district has so often been and still is the direct consequence of an epidemic more or less rapidly controlled in the hospital itself It would appear that some even await the stimulus of legal proceedings"

It is perhaps pertinent to point out that not all masks are adequate in preventing the transmission of organisms The thin linen veil is of little value in this respect, four or more thicknesses of fine gauze preferably interleaved with paper or cellophane, are necessary When once the mask is

[1] *British Medical Journal* January 1, 1938
[2] Ibid, October 23 1937

adjusted to the face it should not for obvious reasons be fingered the mere provision of a face-piece may actually increase the danger unless it is used in an intelligent and conscientious fashion A puerperal patient who develops pyrexia should at once have a sample of vaginal secretion submitted to bacteriological examination Dr Fry emphasizes that there is no substitute for such investigation and that delay in ascertaining the presence of haemolytic streptococci may have dangerous consequences Evidence positive or negative is of the utmost value for on it depend both the manner of treatment of the patient and the precautions to be observed in preventing the spread of the infection The further classification of the streptococci according to Griffith's types or Lancefield's groups (the latter is the more generally useful system in obstetric work but the two methods are complementary to each other) gives more precise information and is essential in judging the significance of organisms found in the throat swabs of 'contacts' Bacteriological work of this nature is time-consuming and Dr Fry makes a strong plea for the establishment of suitable regional laboratories The diagnosis of streptococcal sepsis and the prompt suspension from midwifery work of a nurse or doctor found to be a carrier of virulent infection raise problems which are essentially similar to those associated with the treatment and control of diphtheria and in such matters the practitioner will doubtless look for equal help from the bacteriological laboratory

The question of air-borne infection has lately received attention In some French surgical clinics there is evidence of a return to Lister's early ideal of a germ free atmosphere and an attempt is made to rid the operating theatre air of dust by electrical precipitation or to render it innocuous by chemical means The importance of dust as a factor in the spread of sepsis has been shown by the fact that the sweepings of rooms in which patients suffering from known types of haemolytic streptococcal infection were nursed have been found to contain the identical organism in virulent form for periods up to ten weeks Such dust has in fact produced human infection With this in mind Dr Cassie advises that the lying in room or ward should be washed polished or cleaned with a damp mop but never dusted Other points in the management of maternity homes—such as sterilization of bed pans—are also discussed in her paper

One woman in every three who dies as the result of childbirth dies from sepsis The most recently available figures show an encouraging trend but it is certain that we are still far from reaching the irreducible minimum in this the most important of any single cause of maternal mortality

NICOTINIC ACID FOR PELLAGRA

In 1911 Funk had prepared in a nearly pure state the substance which cured and prevented beriberi in man and polyneuritis in fowls He called it the beriberi vitamine and thought it was a combination of nicotinic acid with a pyrimidine base As further purification of the active substance was attained both by Funk and by other workers it became evident that nicotinic acid was certainly not the anti neuritic factor and its possible activity in other ways was not investigated In 1914 Goldberger with the aid of various assistants began an investigation of the relation of diet to pellagra It had been obvious for some time that pellagra was rife in the districts where much maize was eaten and by accident it was discovered that the condition known as black tongue in dogs could be produced by the same diets that seemed to lead to pellagra in man Thus the dog became available as an experimental animal for work on this disease By 1926 Goldberger and his co workers had become convinced that pellagra was a deficiency disease and was not due to the presence of any toxic substance in the diet More recently Elvehjem and his co workers[1] have made further studies of 'black tongue' in dogs They found that a liver extract cured this condition and that certain highly active concentrates had chemical properties and solubility relationships which together with the observation that nicotinic acid to some extent stimulated growth in rats suggested that it would be worth while to try this compound on their dogs The result was little short of astonishing The appetite improved immediately the dog showed a growth response similar to that brought about by the liver extract and the diarrhoea disappeared This was repeated on three other dogs the amide apparently being as efficient as the acid Meanwhile Chick and co workers[2-3] had been investigating the Goldberger maize diet and the active principle of autoclaved yeast extract which rendered the diet satisfactory for pigs When the outcome of Elvehjem's work with nicotinic acid was announced two pigs were under their observation which had been fed on the maize diet for several weeks and had been used for testing various yeast fractions which failed to produce any effect These pigs were both the same weight as they had been eleven and seven weeks previously they had severe diarrhoea and refused food Both were in extremely poor physical condition and would probably have died within a few days Injections of 100 mg of nicotinic acid were given at intervals

[1] *J Amer chem Soc* 1937 59 1767
[2] *Biochem J* 1937 31 2065
[3] Ibid., 1938 32 10

of three days one pig receiving two the other three injections Afterwards each had 60 mg a day with food Both pigs recovered promptly The appetite returned within twenty-four hours, the diarrhoea abated and they began to increase in weight The skin became clean and of a healthy colour and fresh hair grew They continued to grow rapidly on the maize diet fortified with nicotinic acid Harris[1] has produced in monkeys a disease (monkey pellagra) analogous to human pellagra which he has cured with nicotinic acid

It remained then to test nicotinic acid for its effect on human pellagra Dr A Hassan has used it on five pellagrins in Egypt two of whom were inmates of an asylum and three of a prison The composition of the daily diet the amount of work done each day and the extent of exposure to sunlight were kept unaltered for all subjects One third of a gramme daily of nicotinic acid benefited all five patients but the asylum patients more than the prison inmates which suggested that pellagra as sometimes encountered may be due to more than one dietary deficiency Other workers also have tried the effect of nicotinic acid on pellagrins Fouts Helmer Lepkovsky and Jukes[2] in the U S A gave 0 5 or 1 0 gramme nicotinic acid daily to four pellagrins in hospital on a diet on which it was known that pellagrins did not improve The response was immediate and they were all cured the recovery being in some details similar to that of the pigs In this week's issue two further cases cured by nicotinic acid are reported by Dr M Rachmilewitz and Dr Helen I Glueck (p 346) That pellagra is sometimes complicated by other deficiencies is proved by Spies and Aring's[3] observation that pellagrins suffering from peripheral neuritis (and not all pellagrins suffer from this) could be relieved quickly by injections of vitamin B_1 Aykroyd and Krishnan[4] have found that stomatitis can easily be cured by giving eggs and yeast autoclaved in an alkaline medium They think that the effective factor in curing this condition is probably the factor which cures pellagra in man and black-tongue in dogs, but stomatitis as usually observed is not a serious condition, whereas pellagra is a formidable disease with a high mortality Sebrell, Onstott, and Hunt[5] have demonstrated that whole whey powder, delactosed whey powder, and American cheese are poor sources of the factor that prevents black-tongue

Thus it is that the course of investigation proceeds Some improvement in laboratory technique leads to the recognition of the existence of an essential factor, chemical work leads to its identification further work leads to a knowledge of its distribution and the clinician applies the findings to the relief of human suffering Perhaps the most noteworthy example of this seen in recent years is the discovery of nicotinic acid as the pellagra-preventive factor for man

PNEUMONITIS

The term 'pneumonitis' though criticized by some writers has undoubtedly come to stay In March of this year Morton Gill[1] published an article in which he used the word "pneumonitis" as signifying an inflammatory pulmonary reaction As the aetiology of such a reaction varies Gill divides the condition into three groups—namely (*a*) acute simple pneumonitis (*b*) secondary types and (*c*) chronic pneumonitis Acute simple pneumonitis may occur at any age though most of the cases described were in children and young adults All the patients had pulmonary symptoms but the temperature and pulse and respiration rates were only slightly raised The physical signs included localized areas of impaired resonance and "sticky" rales on auscultation The radiological appearances are not given in detail being described as a localized opacity or heavy shadowing with some enlargement of the hilar glands In all cases the radiological abnormality disappeared within a few weeks In children epituberculosis may simulate pneumonitis but it takes a much longer time to resolve In discussing tuberculosis in young adults Gill refers to Wingfield's[2] "secondary" lesion, which is a localized reaction in a lung allergic to the tubercle bacillus Although radiographically such an allergic reaction may simulate pneumonitis Gill concludes that simple pneumonitis is not a manifestation of tuberculous infection of the lung because x-ray evidence showed that pneumonitis clears up completely, and several of his cases gave a negative Mantoux reaction to 1 1 000 old tuberculin The secondary types of pneumonitis include that which may be caused by influenza and Gill quotes Stuart-Harris,[3] who regards the condition as a "bronchiolitis with patchy atelectasis" Among other examples in this group is the pneumonitis which may be found in association with bronchiectasis and abscess of the lung To include the last is open to discussion, undoubtedly some cases of abscess begin as an acute simple pneumonitis which, instead of resolving, becomes a suppurative pneumonitis, a term which may be regarded as synonymous with abscess of the lung The evidence for the existence of chronic pneumonitis is scanty In a paper on influenzal pneumonitis Woodruff[4] quotes Bowen's[5] statement that in any case of influenza with even apparently insignificant pulmonary symptoms a radiograph will ordinarily show the presence of an exudative process in the lung

[4] *J Mt Sinai Hosp N Y* 1938 5 49
[5] *Amer J Roentgen* 1935, 34, 168

Woodruff gives details of a case of influenza in a man previously engaged in dusty occupations which included working with cement An x ray photograph of the chest revealed a condition of confluent peribronchial infiltration extending from the roots of both lungs into the pulmonary fields The radiograph simulated that of pneumonoconiosis A week later another film showed almost complete disappearance of the infiltration and a fortnight after admission the radiographical appearances were considered normal Our knowledge of pneumonitis especially as regards its pathology is still incomplete The condition has come to be recognized because of the wider use made of x ray examination as part of the routine investigation of diseases of the lung It is important to realize that even in a relatively mild febrile illness with pulmonary symptoms abnormal x ray shadows may appear and may also quickly disappear

SELENIUM AS AN INDUSTRIAL HAZARD

The increasing utilization of selenium and its compounds in industrial processes and the recognition of toxic effects produced in animals by the injection and ingestion of these compounds make it relevant to consider the possible hazards that may be associated with this element in industrial conditions The extent to which selenium exists in the earth's crust is stated by Strock to be 0·005 per cent The principal source of the element at present is from by products in the electrolytic refining of copper and men engaged on this process have been reported as showing symptoms of selenium poisoning with demonstrable quantities of the substance in the urine The primary industries where danger of selenium intoxication may occur are summarized by H C Dudley[1] as follows copper lead and zinc refining roasting of pyrites and in certain districts lime and cement works The secondary industries in which selenium compounds are used are glass and ceramics rubber (vulcanizing and curing processes) steel and brass (alloy furnace fumes) compounding and mixing of pigment for paints and inks, mixing and pressing of plastics melting and casting operations for photo electric cells and in several chemical syntheses The selenium (Se SeO$_2$ SeH$_2$) may attack the worker as dust or fumes and its use in organic combination may make it possible to penetrate through the skin as well as by inhalation and ingestion The soluble compounds of selenium may produce acute or chronic toxic effects and these appear to be proportional to the amount absorbed The acute effects consist primarily of early cellular destruction of the liver parenchyma with later generalized pathological changes throughout the organism Small quantities taken over a long period lead to general debility associated with pathological changes in the liver and kidneys Hydrogen selenide inhaled by guinea pigs causes severe fatty changes in the liver and after a time to *hypertrophy of the spleen* The symptoms recorded among men in copper refineries included pallor gastro intestinal symptoms a garlicky odour in the breath and perspiration nasal and pharyngeal irritation coated tongue metallic taste in the mouth and nervousness and the urine contained selenium These manifestations are in the main the ordinary symptoms of metallic poisoning but the garlicky odour is characteristic and persistent As in all studies of industrial hazards it is essential to establish the physical state in which the selenium may become available to the organism Dusts in a given process may be of such a nature that no soluble selenium compounds are produced Soluble dusts—for example SeO SeO$_2$ H SeO$_3$ H SeO$_4$—and halogen derivatives will be readily absorbed both from the lungs and from the alimentary tract and hence must be regarded as definite industrial risks Although skin absorption has not been established experimentally a case is recorded in which burns from hot acid containing Se$_2$Br were followed by the appearance of selenium in the urine two days later Knowledge is required of the possibility of skin absorption of organic combinations of selenium as they may occur in the processes involved in plasticizers The need for cleanliness and good habits in the works sense among the workers wherever there is a selenium hazard must be appreciated by the industrial physician On the academic side compounds of selenium (sodium selenite) have been shown to inhibit the oxygen uptake of yeast cells and the rate of evolution of carbon dioxide during fermentation of yeast Rats injected with selenium salts show a striking decrease in the ascorbic acid content of the liver and the adrenals The practical importance of these observations requires further elucidation

INHERITANCE OF SEBACEOUS CYSTS

Although sebaceous cysts are common even commonplace the research worker has on the whole paid them scant attention For many years it has been suspected that heredity plays an important part in their causation Cockayne in his well known work *Inherited Abnormalities of the Skin* mentions cases of families in which sebaceous tumours of the scalp were common among the female members (although the males were unaffected) and also remarks upon the cases of multiple sebaceous cysts of which notice was first taken by Pringle who gave them the horrible name "sebocystomatosis In this disease numerous small cysts filled with sebum are scattered over the trunk and extremities both males and females may be affected Recently several families each with numerous members affected have been studied three by Monro and one by Ingram and Oldfield Monro[1] who is more interested in the genetic side of the question than the clinical believes that the cysts result from a single dominant Mendelian factor and that individuals suffering from the condition have the gene in *heterozygous form* It is known that there is a great difference in the effect of an abnormality upon its possessor depending upon whether the gene is in heterozygous or homozygous form In the latter event it often happens that the abnormality is so serious that it is incompatible with life Now among Monro's cases was one in which both husband and wife suffered from sebocystomatosis This

[1] *J Genetics* 1937 35 61

pair had three children (among others) who died in infancy, and who were known to be abnormal hence it is possible that the gene which in heterozygous form produces a minor abnormality here may have been present in homozygous form and have caused a gross disorder fatal in childhood It also appears that there may be a genetical relationship between sebaceous cysts and malignant disease In the families affected by the former there were several cases of cancer Whether this is a mere coincidence or not can only be established by the investigation of further families In the family studied by Ingram and Oldfield a father and daughter and two sons were affected, the mother and four other children were free Several cysts were removed from the daughter and were submitted to pathological examination, the results of which suggested that these cysts arise as new formations and are not due to retention and secretion in a hypertrophied sebaceous gland Indeed, in these cases sebaceous glands far from being hypertrophied are often actually atrophied, moreover, in severe acne, a condition in which sebaceous glands are undoubtedly much hypertrophied, cyst formation is extremely rare Thus we find that modern views on the origin of sebaceous cysts support those of Sir James Paget who as long ago as 1870 formed the opinion that most cysts of the scalp were cysts of new formation, and are unfavourable to those of Pringle, who may be regarded as the advocate of the retention theory Ingram and Oldfield come to the same conclusion as Monro, that the factor which determines multiple sebaceous cysts is a dominant rather than a recessive character

THE CAROTID SINUS REFLEX

The effects of stimulation of the carotid sinus are most familiar in connexion with paroxysmal tachycardia, pressure on the sinus having been practised though not always successfully, for the arrest of this abnormal rhythm More recently the carotid sinus has been related to a form of syncope and the possibility of its implication in essential hypertension investigated The effect on the electrocardiogram in normal subjects, and in those with cardiovascular lesions of carotid sinus pressure has been studied by J Lenegre [1] who finds that in young normal subjects there is no appreciable change, or at most there is some change in rate, usually a slowing Positive responses most commonly evoked in elderly people, and especially in the presence of degenerative cardiovascular lesions, are of three main types a bradycardia with or without auriculo-ventricular dissociation alteration in the form of the ventricular complex, and alteration in rhythm Complete arrest of the heart was noted in several instances, and when this lasted for more than five seconds the subject experienced faintness and vertigo, and more rarely there were convulsive movements or loss of consciousness Some of these symptoms may occur apart from bradycardia, and are then attributed to the reflex fall in blood pressure The reflex was found to be readily exhausted and with continued pressure on the sinus the heart would recover its normal rhythm within ten to twenty seconds, and repeated attempts to elicit the reflex would meet with a rapidly diminishing response A pathological carotid sinus reflex—that is one that leads to anything more than a slight alteration in heart rate—is held by Lenegre to depend on the presence of coronary sclerosis with perhaps lesions in the sinus itself playing a lesser part and the changes in cardiac excitability and conductivity result from the effects of bradycardia and lowered arterial tension on a heart already suffering from ischaemia The routine practice of compression of the carotid sinus with the object of revealing latent cardiac sclerosis is recommended but the distressing symptoms that may result, even though transient will surely discourage most physicians from indulging in this diagnostic aid Many will also disagree with the assertion that pressure on the carotid sinus will not arrest paroxysmal tachycardia in young people The author does not say whether or not his experimental subjects were under digitalis though some of the curves published suggest the action of digitalis, the previous administration of this drug may be of importance in determining the effect of carotid sinus pressure

ADVISORY COMMITTEE ON BLINDNESS

The Minister of Health has appointed an Advisory Committee on Blindness, including its prevention and treatment The committee will carry on the work hitherto performed by the standing committee on the Prevention of Blindness of the Union of Counties Associations for the Blind, which has ceased to exist The following have been appointed members of the new committee Mr P M Evans, LL D (chairman), Mr H R Bickerton M B Mr J D Magor Cardell, F R C S, Miss Grace Cracknall Dr James Ferguson, Mr Percy Flemming F R C S, Mr N Bishop Harman, F R C S, Dr E K Macdonald Miss Ida Mann, F R C S, Mr R Foster Moore, F R C S Mr G F Mowatt, Sir John Parsons F R S, F R C S, and Mr A H H Sinclair, F R C S Ed The committee has been appointed for a period of three years Mr H G Benjamin will be secretary and Dr A E Hallinan medical secretary

TESTIMONIAL TO DR HUTCHISON

In case any reader may have missed the letter published on July 23 (p 195) we would draw attention to the proposal now afoot for presenting Dr Robert Hutchison with his portrait The election of Dr Hutchison to the Presidency of the Royal College of Physicians of London has given great pleasure to a very wide circle of admirers, to whom he stands "for all that is sound in the practice of medicine and all that is good in tradition" The project will we know, commend itself to old students, friends and societies in London Edinburgh, and the Provinces Personal donations should not exceed three guineas Cheques should be sent to the Manager, National Provincial Bank, 10, Marylebone High Street London, W 1 for the credit of the Robert Hutchison Testimonial Fund

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

COLLES'S FRACTURE AND CHAUFFEUR'S FRACTURE

BY

R. A. FITZSIMONS, F.R.C.S.

I. COLLES'S FRACTURE

Of all fractures this probably is the commonest. Its reduction requires neither expert skill nor elaborate apparatus and the after-care is simple. Accurate reduction leads to excellent results in most cases. Failure of reduction always entails some degree of permanent disability. These considerations make the treatment of Colles's fracture a matter of great importance and general interest. While most frequent in women of middle age and onwards it often occurs in younger people of both sexes. Before the age of about 20 when the lower radial epiphysis fuses with the shaft the corresponding injury is a fracture-separation of the epiphysis. This resembles the adult fracture in all essential features and its treatment is the same.

The fracture occurs within about an inch of the lower end of the radius. The situation of the fracture and the displacement of the lower fragment are determined by the local anatomy and the direction of the causative violence. The lower inch of the radius although expanded to twice the size of the shaft is covered by only a thin shell of cortical bone so that it readily yields to a breaking strain. This weakness of the bone is further accentuated by the strength of the anterior ligaments of the wrist joint reinforced by the tendons passing to the hand which explains the comparative rarity of pure dislocation.

In most cases the fracture is due to a fall on the outstretched hand or some equivalent injury. The force of impact is transmitted through the hand and wrist and bears obliquely on the lower end of the radius. The effect of such a force can best be understood by resolving it into two separate components acting in directions at right angles to each other. In the present instance one component displaces the lower fragment upwards along the axis of the radius and the other displaces it directly backwards and also rotates it backwards. Impaction is common and is due to penetration of the soft cancellous bone by the sharp ends of the broken cortex. Further the position of radial deviation into which the hand is forced at the moment of impact often causes the lower fragment to be displaced and rotated outwards so that traction on the internal lateral ligament may result in a fracture of the styloid process of the ulna or a rupture of the ligament. The hand and carpus remain attached to the lower fragment (Figs. 1 and 2).

To summarize this one can say that in a typical Colles's fracture the lower fragment is displaced upwards backwards and outwards tilted backwards and outwards and the ulnar styloid is broken. By far the most constant element of the deformity is the backward tilt and this also is the most important one to correct. In addition there is always some degree of injury to the soft tissues.

Variations of the typical picture are common. Comminution may be present with fissures running into the joint and often separation of the fragments. The bone may be cracked with little or no displacement. The radial styloid or the posterior lip of the radial articular surface may be fractured the rest of the bone remaining intact. Fracture-dislocation is uncommon displacement is marked and fixation sometimes difficult. An appreciation of these points and some knowledge of the normal radiological anatomy of the wrist are necessary for successful treatment.

Diagnosis is generally easy. Pain and swelling of the wrist following a fall generally signify a Colles's fracture. When there is at the same time any obvious degree of backward or radial displacement of the lower end of the radius and hand and an area of maximum tenderness

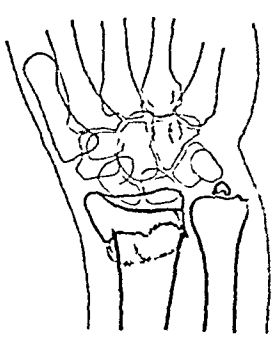

FIG. 1

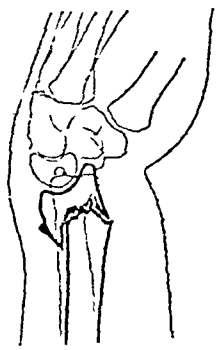

FIG. 2

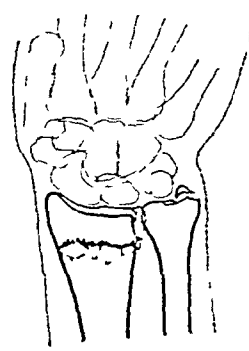

FIG. 3

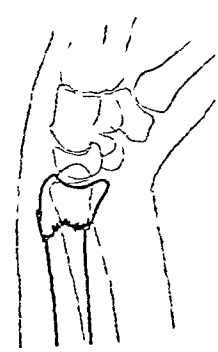

FIG. 4

FIG. 1.—Colles's fracture. Antero-posterior view showing outward rotation and displacement of lower fragment fracture of ulnar styloid radial deviation of hand and abnormal relation of styloid processes.

FIG. 2.—Lateral view showing backward rotation and displacement and dinner fork deformity of wrist and hand.

FIG. 3.—Antero-posterior view after reduction.

FIG. 4.—Lateral view after reduction. The normal anterior concavity of the radius has been restored and the lower articular surface faces slightly forwards as well as downwards.

over the bone just above the joint line, the diagnosis is certain. The classical dinner-fork deformity is found only with severe degrees of backward displacement. Lesser degrees of deformity are often masked by the general swelling, and it is important to realize that, if not corrected, these become much more conspicuous when the swelling subsides. The tip of the radial styloid normally occupies a level about one-third of an inch below that of the ulnar styloid, and an alteration in this relation, caused by the upward displacement of the lower radial fragment, may be felt (Fig. 1). A more constant sign is a loss of the forward concavity over the lower end of the radius, and with average posterior displacement this is usually obvious, even in the presence of swelling (Figs. 2 and 4).

The final diagnosis rests with the radiographs. Cases will occur where no x-ray facilities are available and the question will then arise whether or not the fracture should be reduced before it is radiographed. This should be done if any displacement can be detected clinically, because the physical and mental relief afforded the patient by reducing and immobilizing the fracture more than counterbalances the risk of an error in diagnosis. The risk is always slight, since most injuries which bear any resemblance to Colles's fracture are Colles's fractures. In doubtful cases some temporary immobilization—for example a Carr or improvised splint—will give relief until the radiographs can be seen.

Needless to say all possible fractures must be radiographed after reduction to check the diagnosis if this has not previously been made, to see the position of the fragments, and to satisfy legal requirements. It is only possible to form an approximate estimate of the accuracy of a reduction by clinical means, particularly in the presence of much swelling.

Anaesthesia

The essential surgical requirement is a quiet relaxed patient, any form of anaesthesia which ensures this is a good anaesthetic for the immediate purpose of reducing the fracture, but various other things have to be considered, especially the patient's age and general health. It is impossible, except through sheer good luck, to secure an accurate reduction in a struggling patient.

Local anaesthesia has not yet achieved any great popularity, principally because expert general anaesthesia is available in most treatment centres, but its advantages under certain conditions are so obvious that they deserve to be more widely known. With proper aseptic precautions the method is devoid of risk and can be used where general anaesthesia is for any reason undesirable or unavailable. The patient is not totally incapacitated even for a short period. No special preparation or after-care is required. Repeated manipulations can be carried out with one injection—for example, where x-ray examination shows the position to be unsatisfactory, this procedure usually requires at least two general anaesthesias. Local anaesthesia is unsuitable for nervous patients and children. It is dangerous where absolute asepsis cannot be relied upon, since the solution infiltrates the fracture cavity. It is unsuitable for fractures more than a few days old, when cellular activity is sealing up the spaces between the fragments. Finally, it cannot always be relied upon to produce complete anaesthesia on account of associated injury to soft tissues, which the solution may not reach.

Technique of Local Anaesthesia

The requirements are a sterile 2 per cent. solution of novocain, a 20 c.cm. Record syringe, needles (No. 1 Record), tincture of iodine, and sterile dressings. The novocain solution must be of guaranteed sterility. The safest solutions are those in rubber-capped bottles or sealed glass ampoules, which keep indefinitely. Solutions contained in ordinary corked bottles are always suspect.

The syringe and needles are sterilized, preferably by boiling. The back of the forearm, wrist, and hand are cleaned and swabbed with iodine. The surgeon's hands are sterilized as for any aseptic operation. The position of the fracture line is judged by palpation and previous reference to the x-ray films. The needle attached to the syringe containing the anaesthetic is made to pierce the skin over the back of the radius a little above the estimated line of the fracture and between the long extensor tendon of the thumb and the common extensor tendons, and is then pushed in an oblique direction downwards and forwards until it enters the haematoma cavity. With average backward displacement there is no difficulty in doing this, with minor displacements a few trials may be necessary, but a single skin puncture is sufficient. The tip of the needle is known to be correctly placed when (1) the solution flows readily from the syringe with moderate pressure on the piston, (2) blood can be aspirated into the syringe, (3) the injection does not raise a local swelling as it would do if placed in the superficial tissues. About 15 c.cm. of novocain are injected into the radial fracture, and then a few cubic centimetres around the ulnar styloid. The anaesthetic should be given about five minutes to act, after which the fracture can be reduced.

Reduction and Fixation

For the actual reduction it is desirable, though not essential, to have the help of two assistants, who need not be skilled. Their function is to steady the limb and maintain the reduction while the splint is being applied.

A dorsal unpadded plaster-of-Paris slab is recommended as being both safe and efficient for all cases with average displacement, but for gross displacements an encircling plaster cast is advisable. The distance from about two inches below the elbow to the knuckles is measured, and a dry slab equal to this length is made from a six-inch-wide plaster-of-Paris bandage so that it contains eight folds or thicknesses of muslin. One of the assistants holds and steadies the elbow while the surgeon takes a firm grip of the fingers and exerts vigorous traction in the axis of the forearm, followed by a forced extension movement. This disengages the fragments, whether impacted or not, and the lower fragment can now be felt to move with the hand. While full traction is still maintained the wrist is flexed and the hand forced to the ulnar side and at the same time the lower fragment is taken between the thumb and forefinger of the surgeon's free hand and pressed forwards and towards the ulnar side as strongly as possible. The restoration of the normal anterior concavity of the radius, which is the clinical proof of a satisfactory reduction of the backward displacement, can be felt by the index finger. The patient's hand is now transferred to the second assistant without disturbing the position or the traction. Separation of the fragments of a comminuted fracture, if present, must be corrected at this stage by pressure between the surgeon's hands in the

appropriate plane and where there is radial deviation the final correction of it is now made by lateral pressure

While the limb is still being held by the assistants the plaster is thoroughly wetted in cold water the excess of water squeezed out and the slab applied to the back of the forearm wrist and hand as far as the knuckles The plaster is carefully smoothed out everywhere to adapt it as accurately as possible to the contours of the limb and to prevent creases on its deep aspect which might cause pressure sores The upper end of the plaster extends only about half way around the limb but in the region of the much narrower wrist it extends well on to the flexor surface and care should be taken that it encircles the radial side of the wrist more than the ulnar in order to maintain ulnar adduction The wet plaster is now quickly covered by a few turns of a three inch cotton bandage so that it can be handled more easily The surgeon once more takes the hand still keeping up the traction and again places his thumb this time outside the plaster over the lower fragment pressing it forwards and inwards The plaster still being soft the hand is now placed in its final position usually one of ulnar adduction and about 20 degrees of flexion and held until the plaster has hardened (Fig 5)

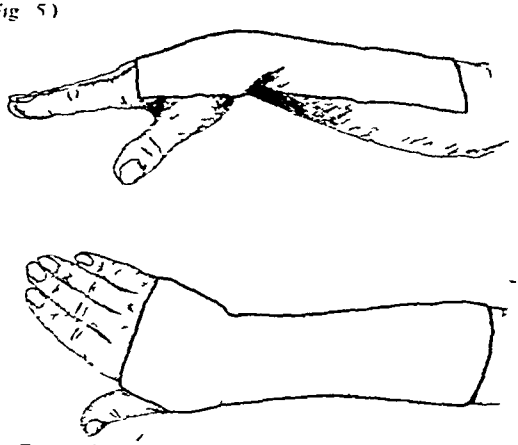

FIG 5.—The usual position of the hand after reduction The plaster slab is shown in outline The dotted lines indicate its anterior limits (Cotton bandage not shown in diagram)

A second cotton bandage is now applied firmly but not tightly beginning at the upper end of the plaster and finishing with a dozen or more turns about the wrist and hand where it passes between the thumb and index metacarpal down to but not going beyond the proximal transverse crease of the palm Plaster or bandages which extend beyond this line limit flexion at the metacarpo phalangeal joints The thumb is left free to move Fixation is completed by a piece of strapping around the wrist and another around the palm

The above technique which takes more time to describe than to perform is applicable to the majority of fractures but has to be modified to suit certain cases When no radial displacement is present in the fracture the position of full ulnar adduction is unnecessary but a slight degree of ulnar adduction is always desirable as this is the physiological position of the hand Where little or no displacement exists it is only necessary to apply a dorsal slab as described with the hand in the neutral position Fractures with gross displacement and also those in which fixation by the dorsal slab has proved unsuccessful generally require an encircling plaster cast The only difference from the routine technique is that in the place of the second cotton bandage a plaster bandage is applied and in exactly the same way This form of fixation gives greater security in all cases but it introduces an added element of danger to the circulation which necessitates closer observation in the post reduction period

In cases with severe backward displacement such as fracture dislocations fixation with full flexion of the wrist is sometimes advisable This should not be maintained beyond about ten days or so because it is a position of strain and it also makes full flexion of the fingers impossible At the end of this time the plaster should be carefully removed the hand brought up to the neutral or slightly flexed position and a new plaster applied It cannot be too strongly emphasized that the reduction of this fracture requires vigorous manipulations and that the great majority of unsuccessful attempts are due to the application of insufficient force rather than to insufficient skill There is no danger of over reduction of backward or outward displacements

Good results can be obtained by the use of rigid splints but plaster of Paris has advantages over all other forms of fixation It adheres to and exerts perfectly uniform pressure on the skin thereby giving a maximum security to the fracture with a minimum danger of damage to the skin and also ensuring that it shall not loosen or become displaced With adequate strength it represents the minimum of bulk and weight so that the arm can be passed through the sleeve and easily used The addition of padding removes these advantages and reduces the efficiency of the splint

Following reduction all fractures must be radiographed in two planes The radiographical evidence of good reduction is (1) in the lateral view the backward displacement and tilt are corrected the anterior concavity of the radius is restored and the lower articular surface of the radius faces slightly forwards as well as downwards (2) in the antero posterior view the outward displacement and tilt are corrected and the styloid processes occupy their correct relative positions (Figs 3 and 4)

Minor degrees of displacement are consistent with good functional results In judging what is a satisfactory position the special circumstances of each case particularly the patient's age and occupation have to be considered and much greater latitude should be observed with elderly than with younger patients in whom an anatomical reposition should be obtained if possible At least one further radiograph should be taken a week or ten days following reduction to see that the correct position has been maintained Later displacements are uncommon

After-care

With average displacements the plaster is retained for a month with severe displacements for six weeks During these times the plaster must not be removed except for the indications I have mentioned After reduction the important instructions to the patient are that the fingers elbow and shoulder shall be used from the first for light work of every kind and that pain or swelling of the hand shall be reported immediately If the patient's co operation cannot be depended upon the movements must be performed daily under the direction of a masseuse A sling if used at all should not be worn for more than a couple of days

The important complication is swelling of the fingers caused by a too tight bandage Slight swelling due to

the trauma is nearly always present, and disappears with time, elevation of the limb, and finger movements. The danger signals are pain, severe swelling, and blueness of the fingers. If these appear the position of the fracture becomes of secondary importance, and pressure must be relieved at once by cutting the plaster. The danger of severe circulatory obstruction is inseparable from the use of an encircling unpadded cast on a swollen limb, and for this reason, as already indicated, it should *not be applied as a routine*. Damage may be caused in a few hours that may not be recovered from in as many weeks, and finger movements may be permanently impaired. *In doubtful cases the only safe thing to do* is to divide the plaster.

There should be a complete range of finger movement and a fair grip a few days after reduction. When the plaster is removed there is nearly always some stiffness of the wrist, which generally recovers rapidly with the patient's own movements. Extension and supination are slower to recover than flexion and pronation, but there is nothing constant about this. The patient's age, the kind of reduction obtained, the presence or absence of swelling, and the patient's ability to co-operate are all important factors, but fractures comparable in all other respects often show considerable differences in the times taken to regain full function.

There is no doubt that physiotherapy helps those patients who are slow to recover movements and also those who complain of slight pain after removal of the plaster. It is doubtful, however, whether it ever influences the ultimate result, and it is quite certain that it *can never give a patient a good wrist and hand where* the initial treatment has been bad. For the majority of patients it is unnecessary, though harmless, except in so far as it tends to obscure what is a clear-cut surgical issue and produce a feeling of divided responsibility between surgeon and physiotherapist.

The sequels of neglect or unsuccessful treatment are various degrees of finger stiffness, weak and painful grip, stiff and painful wrist, and an obvious deformity. The shoulder-joint and elbow-joint may also become stiff from immobilization, as in wearing a sling for too long. The deformity of an unreduced Colles's fracture is an unsightly one, and constantly obtrudes itself on the notice of the patient.

Late Cases

Manual reduction may be attempted with some prospect of success up to about three or four weeks following the injury, after this the use of a wrench or an osteotomy is necessary.

Reversed Colles's or Smith's Fracture

This usually follows a fall on the back of the hand so that the lower radial fragment is displaced forwards. The wrist should be immobilized in dorsiflexion.

II CHAUFFEUR'S FRACTURE

This generally differs from the common types of Colles's fracture only in its aetiology. It may be caused by a sudden forced hyperextension of the wrist or from an actual blow of the starting-handle. Comminution is fairly common, also isolated fractures of the radial styloid process, as from a direct blow. Some of the cases are of the reversed type. Both bones may be broken, either at the lower ends or, occasionally, higher up in the shafts. Treatment, except in the cases of shaft fractures, follows the lines already described.

Nova et Vetera

SOME ECHOES OF WITCHCRAFT

The astonishing story of the town of Hampton in New Hampshire, U.S.A., after 282 years restoring its citizenship to Eunice Goody Cole, tried as a witch in 1656, and according her a martyr's funeral opportunely coincides with the 350th anniversary of the death of one who first regarded witches as mentally sick women.

Johannes Wever, Friend of Witches

Johannes Weyer or Wyer (latinized Wierus) was born in Grave on the Maas, Northern Brabant, in 1515 or 1516. Studying under the sceptical alchemist Cornelius Agrippa at Bonn and afterwards at Paris, he took his medical degree at the age of 22. City physician at Arnheim, and personal physician to Duke Wilhelm of Jülich-Cleve-Berg in a turbulent age he lived a serene life practising his profession and pursuing knowledge. Two of his sons were physicians, of whom one was piously named Galenus. In 1563 appeared his work on the prestidigitatory nature of the devil (De praestigiis daemonum) which was promptly placed on the *Index librorum prohibitorum*. In language essentially composed and even kindly though nevertheless outspoken, he bids the monks leave the management of witches and of the bewitched to the physicians. The pain inflicted on witches is unnecessary cruelty, since their mental anguish is punishment in itself. Among his medical colleagues Wever on the whole found less cruelty but scarcely any more sympathy or understanding. An inquisitive and talented observer he described trichinosis, the English sweating sickness, erysipelas and scurvy. His reputation in medical history securely rests on his humane attitude towards witches, his emphasis on their mental sickness, and his founding of clinical psychopathology. Wever's story was told by Gregory Zilboorg in the Noguchi Lectures 'The Medical Man and the Witch during the Renaissance' (1935) and has more recently been revived by Martin Vogel in the March 17 issue of *Hippokrates*.

Richard Gale, Enemy of Witches

In the December, 1937, number of *the Transactions of the Bibliographical Society* Ethel Seaton gives an account of Richard Galis and the witches of Windsor which, apart from its valuable detective work in bibliography, is interesting because it contains the testimony of the bewitched believer on the one hand and that of his rationalistic father on the other. Gale (Galis) an excitable and credulous fanatic, son of Richard Gale, innkeeper and three times mayor of Windsor, having suffered from the malice of witches, became their implacable enemy. His violent behaviour as self-appointed witch-hunter alienated his father and annoyed the magistrates. Imprisoned in a 'deep dungeon,' in answer to his prayers the chains miraculously fell off his feet. Three months after the hanging of one of the witches in 1579 he brought out a pamphlet written in fervently pious style the main part of which is occupied by an autobiographical account of his personal dealings with the witches. Reginald (Reynold) Scott, the tercentenary of whose birth occurs this year, in his book *The Discoverie of Witchcraft* (1584) alludes to Gale as a madman, and refers to his 'follie lewdness, impudence, and dishonestie.' The most important sourcebook on the history of witchcraft it was written with the object of preventing the persecution of aged and simple persons popularly believed to be witches. Early editions are rare, because James I ordered this work to be destroyed. It is said that from its pages Shakespeare drew inspiration for his portraits of the witches in *Macbeth*.

W. R. B.

Thomas Annandale, who became regius professor of clinical surgery at Edinburgh in 1871, when Lister went to London, was born one hundred years ago. He died in 1907, and at his university his memory is kept green by the Annandale Gold Medal for Clinical Surgery.

ONE HUNDRED AND SIXTH ANNUAL MEETING

of the

British Medical Association

HELD IN PLYMOUTH, JULY, 1938

THE SECTIONS

SUMMARY OF PROCEEDINGS

During the next few months there will be published in the BRITISH MEDICAL JOURNAL *the opening papers communicated to the Scientific Sections of the Annual Meeting at Plymouth. The reports of discussions concluded from last week (p. 313) are intended to give members who were not present a general idea of the proceedings.*

SECTION OF MEDICINE

Friday July 22

Advances in Organotherapy

With DR. F. A. ROLEF in the chair SIR WALTER LANGDON BROWN opened the discussion on recent advances in organotherapy. Recalling Starling's conception in 1905 of a chemical control of the body by hormones he mentioned those subsequent discoveries which had supported this hypothesis. First the recognition of vitamins or exogenous hormones; secondly the principle that a chemical substance was liberated at every nerve ending on stimulation the secretion of adrenaline and pituitrin being only special instances of a general law; and thirdly the discovery by the Needhams and Waddington that Spemann's organizer in the embryo was not cellular but chemical in its activities and that it was closely related to oestrin. Moreover there was considerable overlap between the chemical constitution of certain hormones vitamins and carcinogens. It had been believed in the past that hormones would not act as antigens but the existence of antihormones had been established. A further advance in organotherapy was the realization of the interaction between hormones and mineral metabolism the relation of calcium and phosphorus to parathormone being a notable instance. Zondek's conception of hormones being activated on reaching their destination was connected with this field of metabolic relationships in which further research was required. The postulates for rational organotherapy were that the gland in question should form an internal secretion that the active principle could be extracted and that a method of administration should be available which would admit of its utilization in the body. Organotherapy might then be employed in the following ways: as substitution therapy as a pharmacological agent as antagonist to other hormones to influence general metabolism or in an attempt to utilize antihormonal activity. These substances might also be employed empirically. Sir Walter Langdon Brown emphasized the possible deleterious effects of injudicious organotherapy mentioning examples in relation to thyroid insulin parathormone and oestrin. While oral administration of thyroid was successful this route was not generally available though certain sex hormones in large doses might be useful when given orally. The subcutaneous route was the only effective one for the majority of hormones though they might be given intravenously in emergencies as in diabetic coma. Referring to the problems of receptivity of the tissues the speaker recalled the observation of Zondek that the absorption of a hormone such as thyroxine is decreased in the presence of narcotics such as the barbiturates which adhere to the cell surface and thus displace hormone from it. Perhaps future researches would result in the discovery of simple basal groups which might be effective while escaping disintegration by the digestive juices; possibly newer means of production might result in a reduction of the cost of these preparations.

DR. A. S. PARKES spoke on the relation between method of administration and effectiveness of hormones. He pointed out that the natural action of a gland was not necessarily reproduced by injection of its active principle and there was a distinction to be drawn between the amount given and the amount utilized by the body. Referring to subcutaneous injection of oestrone testosterone and progesterone he considered that three factors should be considered: the rate of absorption the rate of destruction and the rate of excretion. Little was known regarding the last two of these but more work had been done concerning absorption. A substance injected at daily intervals might not be available to the body during a large part of the day. Delayed absorption could be achieved by esterification of the active principle or better still by implantation of it in the form of tablets under the skin. The speaker showed a chart illustrating the influence of the method of administration upon the effectiveness of testosterone when given to rats. Judging the result by the weight of the testes and seminal vesicles he found that the propionate and acetate were both more active than free testosterone. The combined forms could also be given effective at longer intervals than the free testosterone.

Sex Hormones

Professor E. C. DODDS gave his views on the practical use of oestrogenic substances with special reference to synthetic compounds. There was a lack of chemical relationship between the various hormones; some were of protein structure and would if taken by the mouth be converted by the digestive enzymes into amino acids and so rendered inactive. Anterior pituitary and parathyroid hormones were destroyed in this way. Until recently the only hormone which could be given by the mouth was thyroid extract. It was now known that by the introduction of ethinyl groups oestrogenic substances would resist the action of trypsin pepsin and erepsin. Oestriol oestrone oestradiol ethinyl oestradiol and other derivatives had been administered to rats by the subcutaneous and oral routes. Except in the case of oestriol which produced equal effects by the two routes these substances were much more potent when given orally.

DR. S. LEVY SIMPSON described his experience of the therapeutic use of testosterone propionate. He had found that in the castrate rat or monkey this substance would produce a return of the primary and secondary sex characters. There was also a range of activity in female animals the development of the Graafian follicles being inhibited in the monkey a suppression of oestrin secretion had been observed. The speaker had used this substance in the treatment of the human male castrate; these patients (whose deficiency was usually due to tuberculosis or war wounds) were restored in their sexual libido and no longer experienced the hot flushes and migrainous headaches which had previously troubled them. The anabolic effect was also very remarkable: these patients who were usually lean might gain one stone in three weeks when given testosterone propionate 50 mg. thrice weekly. The weight would fall again when the injections were stopped. This substance had also been used for enlargement of the prostate but so far no one had produced conclusive and controlled results to show that it was of value. In women menorrhagia dysmenorrhoea and painful breasts with or without mastitis might be benefited by this preparation. Its use in hyperthyroidism was based upon the expectation that it might reduce the function of the pituitary and so decrease the secretion of pituitary thyrotropic hormone. Contraindications in general were enlargement of the clitoris hirsutism and acne.

DR. G. L. FOSS (Bristol) had used testosterone propionate for the past year. His experience related chiefly to eunuchoidism and menorrhagia. For the former he had found

40 to 60 mg per week an adequate dose, and he had supplemented this with injection Doses of 300 to 1 000 mg had been given for menorrhagia, metrorrhagia, and metrostasis, such doses would give benefit but three weeks might elapse before bleeding ceased With doses of 1 500 to 3,000 mg unwanted side effects in women might occur these were a slight deepening of the voice, acne, clitoral enlargement and growth of hair on the face, this last effect could be reversed by rubbing in an ointment containing oestradiol

Dr S J FOLLEY (Reading), using testosterone propionate had been able to produce mammary development in rats and a growth of teats and breast ducts in guinea pigs In monkeys a duct development of abnormal type was seen, the epithelium being curiously folded Mr V W DIX (London) had treated enlargement of the prostate with testosterone propionate He had found a remission in frequency and other symptoms but agreed with Levy Simpson that it was doubtful whether there was any effect upon the particular variety of prostatic change that occurs in man

Dr ROPER (Exeter) referred to Sir Walter Langdon Brown's remarks on substitution therapy, he considered that in some cases of diabetes there was evidence of recovery in function of the islets as a result of rest

Anterior Pituitary Hormones

Dr A W SPENCE discussed the therapeutics of anterior pituitary and related hormones Thyrotropic hormone was of limited use, it produced the same effect as thyroid extract but in a different way Cretinism and myxoedema were not relieved by it The most important of the anterior pituitary hormones in therapeutics were the gonadotropic hormones whether extracted from the human urine of pregnancy or from the serum of pregnant mares The former preparations were valuable in the treatment of undescended testis but only provided there was no anatomical abnormality Doses of not less than 500 rat units intramuscularly twice a week should be given In the treatment of eunuchoidism the gonadotropic hormones provided a stimulating therapy which could be combined with the replacement effect of testosterone propionate He advised 80 Evans rat units of pregnant mare serum intramuscularly on alternate days, or 500 to 1,000 rat units of pregnancy urine extract intramuscularly twice a week Sterility might be due to hypothyroidism and relieved by suitable substitution therapy, in an uncomplicated case due to failure of the tubules to produce mature spermatozoa gonadotropic hormone might give benefit The same treatment could be employed in women when sterility was thought to be due to failure of ovulation

SECTION OF SURGERY

Friday, July 22

The Septic Hand

Dr H C RUTHERFORD DARLING (Sydney), a Vice-President of the Section presided over a meeting at which Sir DAVID WILKIE (Edinburgh) opened a discussion on the septic hand

There had been Sir David said, an unfortunate tendency to regard infections of the hand as minor surgical maladies But they were of primary importance not only from the aspect of danger to life but because of their potentiality in producing lasting disability in manual workers Much was owed to Bier for his studies of the infective process and to Kanavel for the pathological anatomical pictures Bier's great contribution to treatment was his advocacy of control of the return of blood and lymph from an infected part so that by slight lymph stasis central spread of infection was delayed until immunity was fully under way and the toxins produced were diluted In this country Bier's treatment had been misunderstood, and was taken to imply a well marked venous congestion by elastic pressure Sir David Wilkie thought that Bier's mild passive hyperaemia was a most valuable line of treatment provided it was employed properly Besides this principle of seeking to localize infection while immunity was rising there was now also the powerful aid of sulphonamide He thought that antitoxic serum although overshadowed at present by chemotherapeutic measures, should also always be employed in severe cases of known character

After describing the pathological anatomy of the various hand infections Sir David Wilkie passed to the consideration of those cases of acute streptococcal infection with lymphangitis which might follow upon a punctured wound or scratch The patient should be put to bed and given copious fluids A warm moist dressing should be applied to the limb and a few turns of a thin elastic bandage wound *lightly* round the upper arm This bandage was applied direct to the skin so that a gentle pressure obstructed the superficial veins and lymphatics without producing any blueness or duskiness The secret of successful application was the abolition of pain If pain was increased the bandage was too tight The bandage might be left on continuously for forty eight hours with advantage Treatment with sulphonamide was instituted and 30 c.cm of streptococcal antitoxic serum given after desensitization No incision was made until there was localized pus, except in the case of pulp infections, where earlier incision might be required to prevent necrosis of the phalanx If no improvement was taking place in a pulp infection in forty eight hours then an incision should be made

Immediate Treatment

Mr R KELSON (Liverpool) said that the general view that lymphatic absorption except in the case of the pleura and peritoneum, was a slow process appeared to have been disproved by the experiments of McMaster and Hudack These observers, by intradermic dye injections, had shown rich capillary plexuses one in the papillary stratum of the corium and the other in the lower layers of the corium Within thirty seconds the dye could be seen in the lymphatics 14 to 15 mm away, in forty five seconds 2·5 cm away from the site of injection These experiments showed the necessity for immediate treatment in the case of a prick to delay absorption A handkerchief round the base of the finger or a rubber umbrella ring or locally applied Bier's bandage was suitable McMaster had stated that, while by sucking a wound much material might be removed, much was also distributed locally But mere local congestion was not enough A means of escape for the exudation so evoked should be provided Therefore all pricked fingers should be denuded of epithelium down to the corium around the puncture point This was performed with a razor blade A minute incision should be added if it was thought that the infection had gone deep to the skin, which must be a rare occurrence, since the epithelium cleaned the puncturing agent He thought it was difficult for septicaemia to arise in a wound free from tension By these means an oozing focus was produced Because there was little or no lymph flow in a resting limb immobilization was of great importance He believed that if in lymphangitis there was pain at the site of the puncture a small incision should be made Pus would usually be found It was the surgeon's duty to relieve tension, not to wait for pus, and he advocated incision in all hand infections where after thirty-six hours there was not evidence of the subsidence of all signs and symptoms

Prognosis of Septic Hands

Professor J PATERSON ROSS dealt first with the prognosis with regard to the hand In infections of the pulp one sleepless night warranted incision because of the danger of necrosis of the phalanx This was an exception to his usual rule of waiting for pus The usual result of a tendon sheath infection was a stiff finger which required amputation, but a good result with a mobile finger would be obtained if the sheath was opened up within twenty-four hours, followed by early movements in a hot saline bath He thought that sulphonamide was of value as an adjunct to local treatment because it enabled the patient to move his fingers freely without suffering the severe reactions which used to occur on movement Cellulitis and lymphangitis, though diffuse processes, respected anatomical barriers in the great majority of

cases Where rarely the spread was without respect to the limitations of fascial planes or sheaths the outlook was grave not only for the limb but for the patient's life since there was an obvious constitutional inability to deal with the infection Regarding prognosis as to the patient's life Professor Ross thought that in serious cases it was too often assumed that a virulent organism was to blame Yet in many cases the opposite was true and he thought that a feeble resistance was more often the cause To influence this resistance beneficially fatigue mental and physical had to be avoided The anxious overtired patient had a relatively poor prognosis Similarly a patient with nausea was a poor risk compared to the one who could take his meals It was of importance to maintain resistance by processes of elimination

Mr ZACHARY COPE stressed the economic importance of the septic hand and emphasized the need for rest to the whole upper limb where the hand or a finger was inflamed In diagnosis difficulty might be experienced in distinguishing a thecal infection from a primary osteomyelitis of the underlying phalanx Radiographs should be taken in the atypical case or in the case which did not clear up quickly

Mr A DICKSON WRIGHT advised as a prophylactic measure in infected pricks the immersion of the finger in a pure alcohol bath by use of a rubber finger stall The evacuation of a subungual haematoma by trephining the nail was also a valuable prophylactic procedure Moulded plaster gutter splints gave complete rest A stenosing lymphangitis in the axilla might occur after hand infections and form taut fibrous bands which held the arm to the side Dissections and tenotome incisions were disappointing in this patience and rest were sufficient to cure the condition

Mr CHARLES DONALD said he thought the three chief faults in local treatment were the prolonged use of fomentations not thoroughly wrung out incisions before pus was present and the making of small stinging incisions when pus was present No notice should be taken of finger creases where incision was required It was too generally assumed that lymphangitis and cellulitis were of a streptococcal nature in quite a fair proportion the staphylococcus was the infecting organism Mr JAMES RUSSELL (Glasgow) also advocated the use of the Bier treatment in the early stages and the great need for local and general rest Mr JAMES HARDMAN (Birmingham) said that in fifty out of fifty two pulp infections he had found that one night's loss of sleep meant the presence of pus and that such a criterion for incision was therefore not an exception to the rule of waiting for pus

Mr HAROLD DODD advocated dry heat applications the value of general rest and the use of a tourniquet at operation In the rehabilitation of the stiff blue cold hand he had found the wearing of a thick woollen glove day and night of value The CHAIRMAN emphasized the importance of a general anaesthetic of free and adequate drainage and of a bloodless field at operation

Sir DAVID WILKIE replying said his disagreement with Mr Kennon's procedures was probably more apparent than real The surgeon did not see the cases at the period of which Mr Kennon had mainly spoken He agreed with the remarks about sodden hands and thought that plaster-of Paris was probably not sufficiently used for rest

Surgery of the Heart

Subsequently Mr L F O SHAUGHNESSY gave a short review of the modern surgery of the heart After dealing with the recorded instances of operations for pulmonary embolism and stab wounds of the heart he passed to the curable extrinsic causes of cardiac dysfunction These included dextro and laevo-cardia acquired by fibrosis from chronic lung and pleural disease mediastinal tumours causing either direct pressure on the heart or embarrassing the heart by pressure on the sympathetic and vagus nerves Although these extrinsic causes were rare their occurrence emphasized the need for radiological examination in all types of heart disease Discussing the surgery of the pericardium he was doubtful if its physiological function was as great as had been believed The purely mechanical factor of compression was of considerable importance and timely relief of pericardial exudates gave remarkable alleviation In the late cases of pericarditis it was the consistency of pericardial adhesions rather than their extent which determined the degree of cardiac disturbance There were two groups of cases of chronic adhesive pericarditis In the first group were patients with a large heart visible retraction of the intercostal spaces and often signs of compression of the lower lobe of the left lung For these the operation required was removal of part of the rigid chest wall The second group presented a small heart oedema of the legs ascites and an enlarged liver Actual excision of part of the fibrous pericardium which was encasing the heart and impeding the venous return was required

Turning to the surgery of coronary disease Mr O Shaughnessy said that when an omental graft was used vascular adhesions formed whether the graft was applied to normal myocardium or to the site of a recent or even an old fibrous infarct At the Lambeth Clinic they had performed cardio-omentopexy on twenty occasions Fifteen of these patients suffered from angina and of these five died one on the table one of uraemia three months after operation and three of heart failure two months after operation All the others were greatly improved The other five patients had symptoms of cardiac ischaemia other than angina The most successful case in this group was a woman suffering from hypertensive heart failure Mr O Shaughnessy concluded by discussing the indications for cardio omentopexy

SECTION OF OBSTETRICS AND GYNAECOLOGY

Friday July 22

Chorion Epithelioma

During the first part of the concluding session Miss MABEL RAMSAY (Plymouth) took the chair as Vice President and a paper was read by Mr JAMES RIDDELL (Plymouth) on chorion-epithelioma

Mr Riddell said that this condition was always connected with pregnancy In about one third of cases it followed a hydatidiform mole About 6 to 10 per cent. of moles become malignant Months or even years might elapse before the onset of a chorion-epithelioma The tumour usually occurred in the fundus of the uterus but metastases in the vulva or vagina might be the first obvious growths Secondaries in the brain lungs and heart showed a tendency to regress Formerly it was customary to carry out a hysterectomy for certain cases of mole but the advent of the quantitative Zondek-Aschheim test had rendered this unnecessary After a mole has been evacuated the Z-A test should be repeated at frequent intervals It might remain positive up to two months after evacuation of the mole but more commonly it became negative within a few days It should be remembered that curettage in a patient who was bleeding after the evacuation of a mole carried with it the risk of wide dissemination if a chorion-epithelioma had occurred It was much better in such cases to be guided by the Z A test. If this remained positive after removal of a mole then an exploratory hysterotomy was a much safer procedure Abdominal hysterotomy was best done also in cases of moles where the cervix was closed and in all cases in which doubt arose Several interesting cases were described and discussed

Mr L CARNAC RIVETT (London) pointed out that the reappearance of a positive Z-A test after a negative one was the important point in the diagnosis of a chorion-epithelioma following a mole He also uttered a word of warning against too much reliance being placed on a high quantitative result In a case of twins this was found to be positive in 1 100 dilution He strongly agreed that it was better to perform an abdominal hysterotomy than to curette in cases of doubt. Professor J PRESTON MAXWELL (Peking) remarked that many abortions showed more or less hydatidiform degeneration He agreed that a hysterotomy was better in cases of mole where the cervix was closed The Z A test might remain positive

for three months after a mole was expelled It was the re appearance of a positive result which was the significant finding

Investigation of Sterility

MR ALBERT SHARMAN (Glasgow) read a paper on personal experiences in the investigation of sterility He said it could be roughly estimated that there were about half a million sterile couples in Great Britain Sterility was reckoned by German authorities to cause a deficit of 100 000 births each year Only two aspects of the problem of sterility were dealt with—namely anovulation and tubal blockage In 188 cases of sterility where endometrial biopsy was carried out within five days of menstruation 174 patients had normal premenstrual endometria Thus only 7 4 per cent of this group showed anovulation A large series of normal and abnormal endometria were shown also photomicrographs of daily biopsies on one patient throughout a complete cycle In a series of 309 cases of sterility where the tube was in sufflated it was found that there was complete non patency in 40 per cent a much higher incidence than usually reported The kymographic method of Rubin was utilized for this work The advantages were that the patient did not need to go into hospital and also a permanent record of the case was obtained Lipiodol was a most useful adjunct in diagnosis Several interesting charts illustrating various forms of tubal contraction were shown

Professor J PRESTON MAXWELL (Peking) said that he had used the kymographic method for two years and although very satisfied with it he thought that lipiodol was quite as important in that it showed the exact location of the blockage which was important when operative measures were being considered Professor F J BROWNE also preferred the use of lipiodol which was inserted by the radiologist He thought true anovular menstruation was exceedingly uncommon and had never discovered a true case in a woman bleeding at regular monthly intervals

Hormone Therapy in Gynaecology

Dr M BOYCOTT (London) in a paper on this subject said that the hopes that were entertained of successful hormone therapy had not been realized and all treatment employed was only a form of substitution therapy with all its disadvantages In primary amenorrhoea the production of cyclical bleeding was justifiable only as a means of correcting the patient's mental and physical under-development In secondary amenorrhoea with pituitary failure there was no certain method of pituitary stimulation but giving the patient small doses of oestrone was harmless and often successful Patients showing early myxoedematous failure were those who responded best to treatment He did not consider it justifiable to attempt to re establish regular bleeding in patients with ovarian failure and it was unnecessary to treat amenorrhoea with a psychological cause by hormones as it was usually spontaneously corrected To avoid further depression of the pituitary intermittent oestrone therapy must be used and the dose of oestrone which was all given in the first half of the cycle only could be regularly diminished Treatment with progesterone would shorten the duration of menorrhagia of puberty but he had found both progesterone and luteinizing hormone ineffective in menopausal menorrhagias and in metropathia haemorrhagica The treatment of habitual abortion with progesterone, though it had no rational basis, was often successful when begun as soon as the Friedman test was positive An attempt was being made to correlate a low gonadotropic hormone production with this condition Hormone assay was a lengthy business but Dr Boycott felt it was desirable as a method for the direction and control of treatment It limited the number of cases dealt with and a long time must pass before sufficient material would accumulate to allow any dogmatic statement on treatment or progress

Dr JAMES RIDDELL (Plymouth) referred to the difficulties of hormone therapy in panel practice The cost of hormones was so high that it was impossible to treat all cases The problem of hirsutes in the female was a difficult and tragic one and the results of oestrin therapy in these cases were apt to be disappointing Dr S M DAVIDSON (Plymouth) described a very interesting case of extreme hypoplasia treated by oestrin Treatment had resulted in the growth of the uterus vulva and breasts with a marked improvement in the mental state of the patient Dr BAILEY (Plymouth) mentioned that the use of oestrin was often very beneficial in mental involutional states

SECTION OF ORTHOPAEDICS AND FRACTURES

Friday July 22

Fractures involving the Knee-joint

With the President of the Section Mr C M KENNEDY (Plymouth) in the chair Mr H OSMOND CLARKE (Manchester) opened the discussion on fractures involving the knee joint excluding the patella

Mr Clarke thought it likely that these fractures, hitherto uncommon might soon be seen more frequently as the commonest cause was a blow from the bumper (American fender) of a motor car At Manchester it was found that this group constituted 0 67 per cent of all fractures ninety four cases had been observed during a period of eight years —twenty in the femur and seventy-four in the tibia The femoral condylar fractures gave little trouble fifteen of them being mere cracks and none of them comminuted Fractures of the tibial spine of which there were fifteen occurred in patients between the ages of 10 and 19 The fragment was torn away by the anterior cruciate ligament strain on the ligament occurred not as was usually supposed in hyper extension of the joint but by the femur being driven backwards on the tibia with the knee in a position of flexion Closed reduction was always possible and the joint was held by plaster in full extension for from six to eight weeks The *bête noire* of knee joint fractures and unfortunately, the commonest of them all was the fracture of the tibial tuberosity In five cases both tuberosities were broken in four the medial and in forty eight the lateral These fractures occurred in people round about the age of 50, an age when agility in jay walking tended to decrease It was not surprising to find a predominance of lateral tuberosity fractures for this was the exposed side of the leg and a blow falling antero laterally caused abduction of the tibia on the femur and splitting or fragmentation and depression of the lateral tuberosity The spreading (vertical split) type of fracture presented no particular difficulty replacement by compression with a redresseur followed by plaster fixation being sufficient There was nothing to suggest that the external meniscus was ever an obstacle to reduction A large depressed fragment called for operative replacement with as little disturbance as possible of the neighbouring ligamentous and tendinous attachments The difficulty came in dealing with the relatively frequent cases in which the lateral tuberosity was pulped as well as depressed—presumably due to the fibula being driven medially Open operation was disappointing for one found a mass of fragments of articular cartilage and bone Adduction of the tibia and compression of the fragments in the hope that some sort of plateau would re form, was probably the best treatment Since there was no hope of producing a smooth surface for articulation with the lateral femoral condyle the lateral meniscus ought certainly to be preserved

Mr CHARLES E KINDERSLEY (Bath) described a method of dealing with the difficult fractures of the tibial tuberosities He pointed out that comminution of the lateral tuberosity was followed by a scattering of fragments not only laterally but anteriorly and posteriorly For this reason he advocated circular compression at the site of fracture After applying traction to the limb through a pin transfixing the os calcis he elevated any obviously depressed fragments with an instrument inserted through a puncture wound Circular compression was then achieved with a rubber bandage applied from below upwards this squeezed the fragments up into place A few blows with a heavy hammer disengaged any half impacted fragments and allowed the bandage to squeeze

them into place Remarkable reconstruction of the tibial plateau had been obtained by this method and the end results in the first three cases were excellent

It was also the experience of Mr A M A MOORE that fractures into the knee joint were relatively uncommon In a series of 6 106 fresh fractures he had found only thirty one of which one third were femoral and the remainder tibial He dealt with the femoral condylar fractures by pin track through the upper end of the tibia aspiration of the enormous effusion that so often was present and replacement of the fragment either manually or with a redresseur or in a difficult case by inserting the point of a Steinmann's pin and levering the fragment into position After subsidence of the swelling a plaster was applied for a period of about eight weeks The immediate results of this treatment were gratifying but it remained to be seen whether osteo arthritis would develop later

A New Technique

Professor JOSEPH S BARR (Boston Mass) described an operation which was of value for fractures of the lateral tuberosity of the tibia where there was a cortical fragment of some size The knee was rested for ten days after the patient was admitted and then explored through an antero lateral incision The lateral meniscus which was usually damaged was removed the origin of the anterior tibial muscles was reflected from before backwards until the anterior fracture line was reached The lateral fragment was displaced outwards and such smaller fragments as might be present were built up to form a reasonably smooth joint plateau The lateral fragment was replaced and held in position by means of a Sherman bolt passed through to the medial surface where through a separate small incision a nut was screwed on Before the wound was closed the knee was flexed and the lateral joint surface of the tibia inspected After immobilization for one week active movements were permitted in a hinged Thomas splint Six cases had been treated by this method and the results were gratifying

Mr K H PRIDIE (Bristol) had been able to treat malunion of a femoral condylar fracture by open replacement of the fragment and fixation with a Sherman screw For fractures in the region of the knee generally he preferred traction and early movement to fixation in plaster A troublesome and apparently inexplicable sequel of these injuries was painful hyperaesthesia over the upper end of the tibiae Mr S T IRWIN (Belfast) had also had difficulties with depressed fractures of the lateral tuberosity of the tibia and he was grateful to Dr Barr for describing a satisfactory method for open reduction Mr CLARKE in reply said he thought that Kindersley's method was probably the best where comminution was the chief feature of a fracture of the lateral tibial tuberosity and Barr's operation where there was a fairly large fragment He too had seen patients with troublesome hyperaesthesia over the upper end of the tibia and he suspected that it might be due to minor damage to the external popliteal nerve

Acute Poliomyelitis

A paper on the diagnosis and treatment of acute poliomyelitis was read by Miss MAUD E FORRESTER BROWN (Bath) The time was overdue she said for us to appreciate that this disease should be borne in mind whenever a child was seen in the early stages of a febrile illness Such local signs as abdominal pain and diarrhoea might herald the onset of the disease and it had recently been observed that transient effusion in a joint might be an early sign A most valuable account was given of other early signs particularly those that led to establishing the diagnosis Splints rather than plaster were recommended for a position of physiological rest for muscles Serum and electrical treatment were of no known value The paper was discussed by Mr D O BROWN (Melbourne) and Dr L O BETTS (Adelaide) Mr H O CLARKE (Manchester) asked if there was any harm in moving the joints of a paralysed limb once a day in order to avoid stiffness the speaker answered that it was her regular practice and she thought that its effects were entirely beneficial

Mr GEOFFREY J LILLIE (Exeter) reported the results of eighty two spinal manipulations In the majority the complaint was one of pain in the lumbo sacral region In fifty-seven cases there was an abnormality of posture and radiographic evidence of arthritis in seventeen The results were on the whole not dramatic Pain was relieved immediately in eleven cases and after an interval in twenty four there was improvement in twenty-eight and no change in nineteen Observations made by Burrows and Coltart on a series of cases treated at St Bartholomew's Hospital led to similar findings The conclusion was that manipulation for pain in the back not due to serious organic trouble was a valuable procedure though by no means a panacea

Mr H J SEDDON read a paper on the diagnosis of early tuberculous arthritis of the knee by examination of an inguinal lymph gland Positive findings were obtained in fourteen out of seventeen undoubted cases of tuberculous disease In ten cases subsequently shown to be non tuberculous uniformly negative examinations were reported The value of the method was chiefly in its simplicity though a negative finding did not unfortunately exclude tuberculous disease

SECTION OF PUBLIC HEALTH

Friday July 22

Development of the Hospital System

With Dr T PEIRSON (Plymouth) a Vice President in the chair a discussion on the future development of the hospital system was opened by Mr R H P ORDE (Honorary Secretary British Hospitals Association) who dealt with the subject from the viewpoint of the voluntary hospitals and Dr A S M MACGREGOR (Glasgow) who spoke from the point of view of the municipal hospitals Their papers will appear in the *Supplement* to the *Journal* in due course

Dr W S MACDONALD (Leeds) who spoke from the point of the general practitioner said that the general practitioner was the Cinderella of the hospital system so far as hospital boards and consultants of the large general and teaching hospitals were concerned the cottage hospitals still recognized that the general practitioner was essential to their existence He supported the view that the central hospital of the future should be used almost entirely for consultation and diagnosis and that treatment should be relegated to places where accommodation was not so precious In the field of medicine and midwifery the experience of the general practitioner should be conserved by using him as a clinical assistant under the guidance of consultants the patients interests would be better served in this way and the hospital service would become a more personal one The services of the general practitioner should be used to deal with the problem of the chronic and subacute cases in hospital practice He hoped that in the future the fields of research would not be limited to academic centres

In his unavoidable absence Dr T N V POTTS's paper giving the point of view of a county medical officer was read by Dr E HUGHES Dr Potts discussed the extent to which new general hospital beds appeared to be required as this was a matter of great importance not only to the local authorities but to the voluntary hospitals He said that extension should not be undertaken in a haphazard manner but should be based on a considered policy the local authority and the voluntary institution having constant regard to each other's programmes Most hospital boards and local authorities in planning new hospitals were influenced to a great extent by finance by the hospital waiting lists—an unreliable criterion—and by the variable information obtained as to pressure on beds in existing hospitals He then gave figures showing the number of beds per 1 000 of the population and the contemplated extensions of sixteen county boroughs (population 200 000 to 400 000) and concluded from these figures that this country was very much behind others in the provision of hospital beds In his opinion on an average no less than six general hospital beds per 1 000 of population were needed to cope with the present-day toll of ill health He emphasized

the necessity for considering the extent to which such new general hospital beds should be provided by the local authority on the one hand and by the local voluntary hospitals on the other and described the action taken in this respect by the West Riding County Council

General Practitioner Visiting Staffs

Dr S W SWINDELLS (Grimsby) commented on the increasing number of patients passing from the general practitioner to the whole-time hospital official A policy must be adopted that would result in a hospital system under which the general practitioner, as one of a team would *take* not *send* his cases into hospital using what specialized assistance was necessary or available Apart from those cases admitted for specialized investigation or treatment there were many which were sent into hospital because the doctor could not observe, investigate or treat them in the patients homes though such care might be well within his province A practitioner visiting staff would be financially economical compared with a whole time salaried resident staff Dr C LANDER (Gillingham Dorset) drew a parallel between the voluntary hospital to day and the voluntary schools in 1820 Voluntary education was superseded by State education and he thought that the voluntary hospital system would not long survive He commented on the term voluntary, when in most cases a charge was made for treatment He did not like the idea of an essential service being dependent on charity and was in favour of a State service Mr J ARMSTRONG (Ballymena) declared that all the speakers had confirmed his belief that national health should be a primary charge on the national resources Isolated efforts to provide for national health (voluntary hospitals, municipal hospitals, etc) hindered full recognition of this The logical thing was a system of State hospitals which would absorb all types of institutions and lead to elimination of overlapping and to standardization of methods, etc With good will the doctor in charge of a district hospital could make that hospital a centre of contact for the members of the profession

Dr D SAGE SUTHERLAND (Manchester) referred to the place of the infectious diseases hospital, and advocated a scheme of regional co ordination of fever hospitals He felt that in this way opportunity would be afforded for retaining the medical staff and the more highly skilled members of the nursing staff for a longer period in the fever hospital service Dr W ASTEN (Bournemouth) said he was mainly concerned with the administrative aspects of the question The Voluntary Hospital Commission had indicated that the voluntary and the municipal hospital must work side by side He was in favour of full co operation in hospital administration He commented on the disparity in various areas between hospital accommodation in relation to population

Dr C E S FLEMMING (Bradford on Avon) thought that the voluntary hospitals would not last long—in spite of the public desire for their continuance—if they did not do all they could to co operate with the municipal hospital service The general practitioner was the backbone of medical practice, but in the hospital service he was a backbone without ligaments or muscles he was, however, essential Dr Flemming commented on the lack of facilities outside hospital for the newly qualified man to carry into practice the high standard of technical clinical knowledge he had acquired in the training schools and his professional hopes and ambitions were destroyed He declared that the general practitioner should be provided with institutional beds somehow or other otherwise his clinical knowledge and technical training would in part be wasted, and the public denied the full benefit of medical skill to which they were entitled

Dr W ALLEN DALEY President of the Section emphasized the importance of full co operation between the voluntary and municipal hospitals Before providing new accommodation there should be mutual consultation He deprecated the tendency of voluntary hospitals to find the capital for new beds without making adequate provision for cost of maintenance In connexion with the regional provision of hospitals he suggested that the same area should be covered by both public health services and general hospital services, and advised that the hospitals should be used so far as possible to provide the various clinic services of the public health departments Except for fever hospitals and sanatoria the special departments—maternity ophthalmic etc—were better as sections of a large general hospital than as separate self contained entities Finally he referred to modern developments in the treatment of acute infectious disease and the prevention of cross infections and expressed the view that it was impossible to do justice to the patient in a small fever hospital In that field of work regionalism was essential

SECTION OF PHYSICAL MEDICINE AND EDUCATION

Friday July 22 (at Torquay)

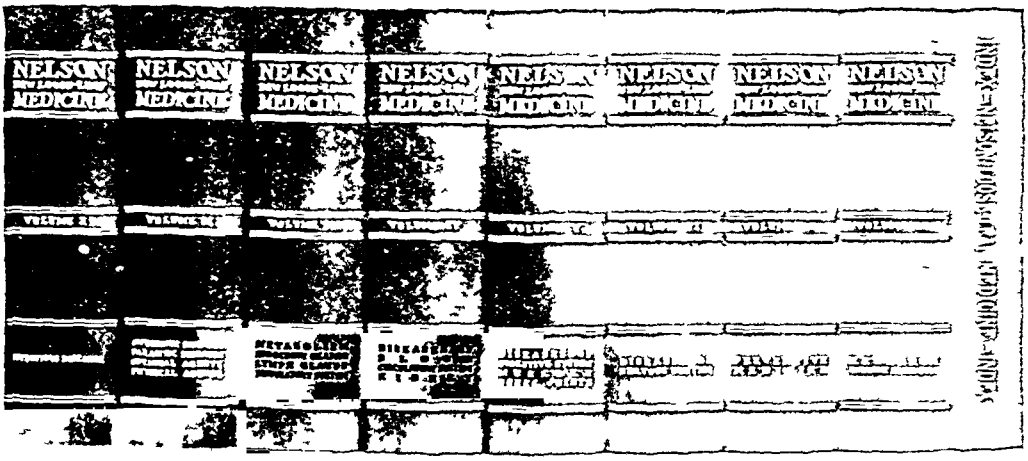
The Basis of National Fitness

With the President Dr V I CARVER (Torquay) in the chair Professor T P CATHCART (Glasgow) read a paper on the physiological approach to national fitness, his paper appeared in the *Journal* of August 6 (p 273)

Mr V E PORRITT speaking on fitness and the average man defined fitness as a state of being well adapted The average man had so far failed to react to the National Fitness Campaign which had been launched at a difficult time but the idea was lying fallow for a period as did most new ideas in this conservative country The next move must necessarily rest mainly with the general practitioners and consist of gradual education of interest in personal fitness housing children's recreations physical training under medical supervision and particularly social recreation out of doors He suggested that every branch of the B M A should have one meeting with a qualified speaker to discuss the best method of stimulating interest and that every practitioner should inquire into the recreations of his patients Fitness depended on what a citizen did to and for himself

Dr I P LOCKHART (Nottingham) discussing fitness and the industrial worker said that the essentials were good management good leadership and good wages Work could be looked upon as a form of occupational therapy and pride of craft was essential to contentment He then outlined various subjects deserving study in relation to industrial workers—for young persons medical supervision protection from exposure and acquisition of specific skill for women proper footwear proper midday meals and abolition of the no breakfast habit, and for the industrial worker generally protection from noise and dust suitable working clothes, family allowances, Sunday games, and the provision of creches

Physique of Recruits



Major General H H A EMERSON Director of Hygiene War Office spoke on fitness and the Services Any man of suitable age was accepted as a recruit unless suffering from a serious incurable defect and only 2 per cent were later discharged on medical grounds During their first three months training they usually gained about 9 lb in weight, one third of an inch in height 16 per cent increase in power of grip and were smartened up in every direction Each man was watched as an individual and special corrective exercises employed as required Both satisfactory environment and education were necessary to produce fitness, and both were present at the training depot

Fitness and the Marine Health Resort

Sir HENRY GAUVAIN (Alton) discussing fitness and the marine health resorts said the health of residents at marine health resorts tended to become stabilized at a normal level but to the visitor the sea was a strong stimulus increasing the basal metabolic rate very greatly A normal individual should take his holiday in August and the benefit would carry him well into the winter In the early spring the body received the stimulus of increased light and this stimulus continued until about June After that there was a tendency to stagnation, and by August a further stimulus was desirable A few

Testimony by members of the Medical Profession . . .

Read what a doctor says —

" 'Ty phoo' tea is delicious and has given every satisfaction, being free from the irritating effect on the stomach which is inseparable from ordinary tea Those patients to whom I have recommended it amply bear out my own views "

The above is one of many hundreds of testimonials received

Medical men and women, throughout the country, are recommending our pure " Ty phoo " tea as indicated by the daily despatch of hundreds of samples which doctors direct us to send to their patients

Delicious

"Ty-phoo" TEA is so mild that it does not cause indigestion

Over 18 000 DOCTORS use "TY PHOO" in their own homes

Further,

you save by using " Ty phoo," for being so rich in " leaf-edge " it " goes just half as far again " as coarse astringent tea

Write to

Sumner's Ty-phoo Tea Ltd , Birmingham, 5, for a FREE sample

(This offer applies only to the British Isles We regret that we cannot send ' Ty phoo tea abroad)

Ergoapiol-(Smith)

A Menstrual Regulator . . .

When the periods are irregular, due to constitutional causes, ERGOAPIOL (Smith) is a reliable prescription Containing apiol (M H S special) together with ergot, aloin and oil of savin of the highest quality, this preparation effectively stimulates uterine tone and controls menstrual and postpartum bleeding

In cases of *Amenorrhea, Dysmenorrhea, Menorrhagia* and *Metrorrhagia,* Ergoapiol serves as a good uterine tonic and hemostatic Valuable in obstetrics after delivery of the child and for the menstrual irregularity of the *Menopause*

Prescribe 1 to 2 capsules 3 or 4 times daily Supplied only in packages of 20 capsules Literature on request

As a safeguard against imposition the letters MHS are embossed on the inner surface of each capsule *visible only* when the capsule is cut in half at seam as shown

THE EARLIEST MEDICINE IN ENGLAND

PROFESSOR C SINGER'S LECTURE

The Popular Lecture in connexion with the Plymouth Meeting of the British Medical Association was delivered to a large audience in the Guildhall on July 22 by Dr CHARLES SINGER Professor of the History of Medicine in the University of London Dr H G DAIN presided and introduced the lecturer

Professor Singer whose subject was The Earliest Medicine in England began by quoting Kipling

> Wonderful little when all is said—
> Wonderful little our fathers knew
> Most of their medicines killed you dead
> All their knowledge was quite untrue

The earliest medicine in England should of course be Celtic medicine but unfortunately the records of that had disappeared The British with whom Caesar had so much trouble—Boadicea Caractacus and the rest—were too recent immigrants and hardly had a culture of their own nor did they absorb the culture of the previous inhabitants Celtic medicine properly speaking hardly existed not even Celtic superstition Such medical works as had survived in Celtic languages were substantially translations from the Anglo Saxon It was therefore Anglo Saxon medicine he proposed to talk about that evening

What were the sources of knowledge of this subject? A hopeful source would seem to be folklore and folk habits Over quite a long time stories from peasants in out-of-the-way parts of the country were collected but the results were disappointing There were many medical superstitions and habits among our country folk but prolonged examination proved that they were not really of very early origin Now and again a glimpse of Anglo Saxon folk medicine was obtained from monuments—as for example from the tenth century fertility figure in the church at Oakley Wiltshire Far and away the best source was the actual written documents Some twenty or twenty five medical documents dated from Anglo Saxon times some of them written in Anglo Saxon some in Latin For the most part these MSS were written in a sprawling hand with well formed letters but when magicians wrote their magic on paper they were reluctant to write it completely and intentionally left out certain words or letters That was the chief difficulty in reading the MSS

The Anglo-Saxon Doctor

What kind of people practised medicine in Anglo Saxon times? The idea had got about that they always came from monasteries because it was believed (not quite accurately) that the only people who could read or write were the monks But pictures of Anglo Saxon medical men which Professor Singer showed his audience revealed that they were not tonsured a feature about them indeed was their abundant locks Moreover in many medical MSS certain remedies were set out for the use of which the calling in of a priest was necessary which could not have been the case had the man giving the remedy been a priest It was more than probable that the Anglo Saxon leech like the Celtic belonged to a special family of leeches Such families were known in the Highlands and also in Wales where one of them only became extinct in the eighteenth century In Anglo Saxon England there were almost no towns the biggest was Winchester with a population perhaps of 5 000 There were no roads and in the absence of towns and roads it would be impossible for the medical man as known to day to make a living It seemed probable that the medical men were farmers who had gained a reputation for their skill in remedies and were consulted by their friends and neighbours from time to time and that these farmers passed on their knowledge to their sons

The best picture of the way in which these people worked came from a German source which was less remote from Anglo Saxon England than might be thought In one document prepared in Germany in which the illustrations were clearly under Anglo-Saxon influence doctors were seen actually at work Nearly all their remedies when not magical were of vegetable origin Weights were not given except in the form that one substance should be twice the weight of the other Some of their anatomy and physiology was derived faintly from the Greek no doubt through ecclesiastical transmission It was the working hypothesis of the Greek men of science that the body had four humours corresponding to the four elements of matter, and by

the mingling of these humours the complexion or constitution was determined This idea was adopted in a distorted form in the Anglo-Saxon The four humours were also associated with the four seasons of the year and the Anglo-Saxons played with the idea and weaved it into all kinds of absurd and imaginary schemes It was strange how little bits of classical ideas crept almost by accident into Anglo-Saxon writings The Anglo-Saxon doctor did not put much stock in theory Most of his books were made up of remedies He was a practical man—and the practical man, said Professor Singer, was the most dangerous of all practitioners

Influences on Anglo-Saxon Medicine

On studying these remedies Professor Singer was able to divide them, according to their sources, into eight groups Some owed their origin to Greek medicine, others to ecclesiastical influence, others again were derived from Salerno, a very few were native Teutonic, fewer still had a Celtic tinge, some of the herbal lore suggested an origin in Southern Italy, some had a Byzantine origin, and a certain residuum came from pagan Rome

As an illustration of the first of these sources he mentioned the centaur, which was copied into Anglo Saxon herbals As for ecclesiastical sources, illuminating sidelights were often found in marginal inscriptions in missals A good one was from an eleventh century MS prescribing as a means of stopping bleeding the marking of a cross in blood on the forehead, and to the prescription were added two words which were the central words of the Greek mass A good many of the Anglo Saxon drawings in herbals were taken from Salernian sources, these included the story of the uprooting of the mandrake, which in its Anglo-Saxon form passed direct into Anglo-Norman medicine Native Teutonic magic had certain characteristics which rendered it unmistakable when it came into the Anglo Saxon Here the belief was expressed that there were certain venoms or poisons blowing about in the air and causing disease, also that these venoms were arranged, like other evil things, in groups of nine They were associated with the serpent, or sometimes in the Anglo-Saxon with the worm, and it was also considered that many diseases were due to what was called in the Anglo-Saxon elf-shot The idea of poisons blowing about in the air corresponded to the German word *Blase'* from which came our word ' blast, both a blowing of wind and an oath The pernicious influence of the figure nine had passed into all kinds of modern folklore, it was well illustrated in *King Lear* and in the incantations of the witches in *Macbeth*

> Weary seven nights nine times nine
> Shall he dwindle, peak, and pine

As to the "elf-shot,' the word "elf" had quite a different meaning in Anglo-Saxon times, and often meant Satan or the devil, a terrifying being, whose darts were felt as a stitch or sharp pain By Shakespeare the elves had become merely mischievous imps, and the *Midsummer Night's Dream* would have been incomprehensible to an Anglo-Saxon audience

Finally, by some queer chance or misunderstanding, Anglo-Saxon texts were found to include certain pagan Roman charms which must have been brought over by Latin ecclesiastics under the mistaken idea that they were Christian The lecturer read one such invocation, pointing out that it was clearly pagan, and that the ecclesiastic who had brought it had mistaken a pagan goddess for the Virgin Mary Among saints frequently invoked in Anglo-Saxon charms was St Columcille, abbot of Iona, and St Germanus, who gave his name to St Germans in Cornwall

---

One-third of the medical profession in Yugoslavia are in practice in the three principal towns of Belgrade Zagreb and Ljubljana The Government has therefore decided that for the first two years after qualification all doctors must practise for two years in places with less than 4 000 inhabitants

A PROFESSIONAL JURISDICTION FOR THE BELGIAN MEDICAL PROFESSION

BY

RENE SAND, M D

Ministry of Public Health Brussels

In Belgium, as elsewhere, medical practitioners are submitted to the civil jurisdiction for legal contests with their patients and to the criminal jurisdiction for trespasses against the law The practice of the art of healing by unqualified persons is repressed by the Courts

There was, however no jurisdiction to combat the offences committed by some doctors against professional ethics such as advertising themselves, advertising quick cures for venereal diseases rheumatism, or cancer, exploiting their patients in various ways, and, generally speaking failing in that honesty which it is so essential to keep between doctors as well as between doctor and patient

Ordre des Medecins

To prevent and punish these abuses a law has been passed recently in Belgium establishing an official professional jurisdiction under the name of Ordre des Medecins The text was prepared by the Federation Medicale Belge which includes about 4,000 of the 6 000 practising physicians The Minister of Health, M Arthur Wauters supported the proposal so effectively that it was passed by the Senate and the House with hardly a dissenting voice Thus a long cherished claim of the medical profession has been satisfied

For the purpose of obtaining an authorization to practise, every doctor is required to register with the Ordre, and this can only be refused if the applicant has proved himself morally unworthy There is a right of appeal against the decision to exclude

Duties of Provincial Councils

In each one of the nine Provinces a Council, elected by the medical practitioners from among themselves, investigates and passes judgment on every case submitted to it A professional judge advises the Council, but has no vote

> The Council is entrusted with a mandate to maintain the rules of medical ethics, the honour the discretion, and dignity of the members of the Ordre in the exercise or at the occasion of the exercise of their profession
>
> The Council deals with questions of fees in three cases only (1) when the amount claimed constitutes a serious breach of medical ethics, (2) when both parties agree to submit the case to the Ordre, (3) when the Courts apply to the Ordre for advice
>
> No sanction can be based on religious philosophical political linguistic, or syndicalist motives, nor on the fact that a doctor has contracted with an agency organizing medical care for a group of persons'

This means that the Ordre cannot intervene between the doctors and the sick funds, the public assistance authorities, etc

Court of Appeal and Superior Council

Above the Provincial Councils sits a Court of Appeal, composed of three Presidents of Provincial Councils drawn by lot, and three professional judges On the other side, the Superior Council of the Ordre des Medecins gives advice on general questions, and classifies the judgments passed by the Provincial Councils and the

Court of Appeal so as to build up gradually a co ordinated jurisprudence

The Superior Council is elected by the Provincial Councils with the addition of a professor from each one of the four medical schools existing in Belgium in fact the professor of forensic medicine will be chosen The Council is presided over by a professional judge

The sanctions applicable are admonition censure reprimand suspension of the right to practise for a maximum of two years and permanent suspension of this right This last penalty requires a majority of two thirds in the Council and eventually in the Court of Appeal

The professional jurisdiction seems thus to give every reasonable guarantee to the doctors of Belgium as well as to the public It will no doubt check certain abuses for which very few physicians were responsible but which were a reflection on the whole profession

Annual Meeting of the B M A

HONORARY SECRETARIES' CONFERENCE

The Conference of Honorary Secretaries took place during the Plymouth Meeting on July 20 in the City Council Chamber Dr B E A BATT (West Suffolk) presided

Dr G C ANDERSON (Secretary of the Association) gave a brief address confined to one point He said that the office had had experience during the past year or two of incidents occurring in the Divisions of which it would have liked to have had some prior information An example was a dispute arising in a locality on some hospital matter and the action taken locally had proceeded to a somewhat advanced stage before the office was informed about it It would save a great deal of difficulty if Divisions and Branches would ask early for advice He begged honorary secretaries to report as early as possible on any developments in their locality in the hospital or public health sphere

The Film as Propaganda

Dr H. A NATHAN (Kensington) drew attention to the important part played by the film in propaganda No professional body or organization of interests could afford to overlook its possibilities as a medium for publicity and enlightenment He instanced the success of the pictures made and exhibited on behalf of the National Ophthalmic Treatment Board their function being to explain simply and convincingly, that a medical eye specialist was the only person fully qualified to examine and prescribe for the eyes as living organs of the body In general these films were shown to cinema goers as part of the normal programme and as the cinema going public in this country approximated to nearly twenty millions a week the propaganda value of the N O T B films could not be over-estimated

Films might be employed to advantage in other ways on behalf of the medical profession First of all to counteract the harm done by newspaper reports that were misinformed or otherwise undesirable No one would deny that the general practitioner stood in need of publicity of the right sort Short impressive films exhibited throughout the country could do much to educate the public by giving a sincere picture of the general practitioner as he really was Another direction in which the film might be usefully employed was in teaching the public to realize that counter prescribing by chemists and mail order cures were far from satisfactory and might be dangerous to patients It was time that the public was made to understand that it was unwise to seek advice on health matters from the chemist—a shopkeeper whose primary aim was to secure profits from the sale of patent medicines toilet accessories and cameras and who in any case was not qualified to diagnose disease or to prescribe

There could be useful propaganda by films for recruiting new members of the Association especially among medical students A film illustrating the advantages of the public medical service might demonstrate how people of limited means instead of flying to the quack could get expert medical attention from their family doctor Thousands of intelligent men and women could be reached through the medium of films shown at meetings of literary societies rotary clubs etc Opportunity was here afforded of going deeply into the subject of the doctor's training and work and it could be done in such a way as to convince any audience that on health the doctor's advice was the only advice worthy of consideration Dr Nathan instanced a number of propaganda films serving the purposes of medicine and science which had already been produced—the Pasteur film was one example—and the various subjects including safe milk and national fitness to which the film could be adapted for the use of the profession All such films should be censored or inspected by a bureau of the Association and when passed might bear an inscription to that effect The bureau could also be available for film companies when seeking advice concerning the production of medical and educational films Finally a film illustrating the work of headquarters might do much to answer the repeated query What does the B M A do for me? He moved that the Council be asked to consider the advisability of establishing a film library for the use of Divisions and Branches

In some discussion on Dr Nathan's paper Dr ALASTAIR FRENCH (Metropolitan Counties) said that it was a question of money and it did not seem to him a job for the local professional organization to educate the public It was for this purpose that the Public Relations Department of the Association was created Dr O T J CLAYRE (Southern) thought there was a case for the Council's consideration Dr E V CLAYDON (Eastbourne) took up a remark made by Dr Nathan that novels in which the doctor was faithfully depicted might usefully be put on the screen There was often so much difference between the written book and the film version that he was a little afraid of the idea

The SECRETARY said that he represented the Council on the Medical Panel of the British Film Institute which had made a catalogue of medical films Perhaps there was an inclination to talk too glibly about film production The film produced by the N O T B Eyes Right only ran for three or four minutes but it cost £750 There were two different aspects of the question one the establishment at headquarters of a library of scientific films of interest to the Divisions and the other the making of a propaganda film The latter he thought, would involve an expenditure which the Council would hardly be prepared to sanction Mr McADAM ECCLES commented on the usefulness of a bureau at headquarters at which any member could apply for information in regard to medical films An incidental matter but not unimportant was the provision of projectors at headquarters which could be hired by Divisions Dr MORRIS (Lambeth and Southwark) pointed out the need for deciding as between the different sizes of film—35 mm and 16 mm Dr NATHAN thought that the expense of a propaganda film could be met from the same fund which bore the burden of the publicity campaign He also appealed to amateur cinematographers in the Association to let headquarters have a copy of their films

The motion asking the Council to consider the subject was carried unanimously

Publicity Propaganda and the Local Units

Mr A W HASLETT (Public Relations Officer) opened a brief discussion on the bearings of the new publicity propaganda of the Association on the local units He described the events leading up to the creation of the

Public Relations Department The profession had suffered to some extent from its own aloofness, and the individual practitioner could not as a rule give Press interviews In local areas publicity on behalf of the profession might be called for on occasion, but it was incumbent upon the Division to get in close touch with headquarters

In the course of a brief discussion a number of questions were asked and answered Dr INGLIS CAMERON (Glasgow) asked whether the attention of those responsible for publicity had been drawn to films and wireless Mr HASLETT replied that the B B C was notified of any material which was sent out from the Association to the Press, and talks had been attached to the news bulletin Films had not yet come within his department's scope

Liaison between Divisions

Dr R H ROBINSON (Torquay) asked the conference to express the view that greater facilities should be afforded for the interchange of information between honorary secretaries concerning divisional activities He urged that all Divisions should be encouraged to print their annual reports in a uniform size and style as far as possible, and he exhibited a specimen of his own Division report, which was a four page document of *Supplement* size and conveyed its information succinctly and with plentiful headings In this way Divisional reports would be available for secretaries of other Divisions, and much useful interchange of information would result

Dr J C MATTHEWS (Chairman, Organization Committee) said that the Committee on Peripheral Organization had discussed methods whereby one Division would be enabled to know what another Division was doing The suggestions which Dr Robinson had brought forward would receive consideration at the hands of the Organization Committee next session Dr L KILROE (Rochdale) said that the Branch Council meetings might be usefully turned into meetings of divisional secretaries Dr CLAYRE (Southern) said that in his Branch all the Divisions invited the Branch secretary to attend their meetings

Dr ROBINSON moved that greater facilities should be afforded for the interchange of information between honorary secretaries concerning divisional activities and that one means of doing this would be by the interchange of annual reports This was agreed to

Medico-Political Work of Divisions

Dr A KEITH GIBSON (Regional Secretary, Metropolitan Area) presented a memorandum on the medico-political work of Divisions One of his suggestions was that there should be published in a convenient form at the latest useful date all the motions for the Annual Representative Meeting received up to that time, together with the relevant paragraphs of the Annual Report of Council This should be issued to the secretaries in sufficient number for distribution to members likely to be interested, and a Division meeting could be summoned to which a number of members would come already knowing what was going forward and perhaps what was being done in other Divisions, so that more adequate instruction could be given to representatives and interest in medico-political work promoted Dr NATHAN (Kensington) referred to the work in his Division of a General Practice Subcommittee Every time a man made a grouse he was elected to that subcommittee!

The CHAIRMAN OF COUNCIL said that the Annual Report purported to contain one year's work of Council The first meeting of the Council was held immediately after the Annual Representative Meeting Committees would begin their work in September and October, and an immense amount would be done in the winter months If members only knew the pressure of work on the office they would congratulate it on being able to produce most of it in the Annual Report by April It was impossible, as one member had suggested, to get the Annual Report through at an earlier stage A MEMBER suggested that the Annual Report should be issued at the end of the year, the new Council functioning as from January This would give the Divisions six months to consider the report Mr BISHOP HARMAN suggested that some interest might be given to divisional meetings called to discuss the report if one member were specifically assigned the task of attacking it and another of defending it Dr W PATERSON suggested that the Council be asked to consider the possibility of publishing in the *Supplement* as late as possible all the motions and amendments received instead of publishing them week by week as at present Dr MATTHEWS promised that this would have consideration

Other Business

Dr R H ROBINSON asked that the Organization Committee be requested to consider the adequacy of the present arrangements for bringing to the notice of the Branch Councils information concerning candidates for election to the Association Dr MATTHEWS promised that this also would be considered by the Organization Committee

Dr L KILROE (Rochdale) was elected Chairman of the Conference for 1939, and Dr ALASTAIR FRENCH (Metropolitan Counties Branch and West Middlesex Division) Deputy Chairman

SECRETARIES' DINNER

After the conference the honorary secretaries assembled for dinner at the Continental Hotel, Dr BATT again presiding The chairman's health was proposed by Dr BARBARA ABERCROMBIE who spoke as one of the most junior of honorary secretaries, her tenure of office dating back for only six months Dr BATT, on the other hand, spoke as a veteran whose service as divisional secretary extended back to 1912, with an interval while on active service during the war Dr Batt proposed the health of the permanent staff of the Association Dr ANDERSON in replying, said that he wished the honorary secretaries to bear in mind not himself and his medical colleagues, but the staff behind the scenes who worked most willingly and efficiently in the Association's service It was a loyal staff of good friends who pulled wonderfully well together and made his own job as director of the staff a very happy one

There were the usual calls—and embarrassed responses—for other members of the staff present, including the Deputy Secretary, Dr Hill, the Assistant Secretaries, Dr Macrae and Dr Potter, the Public Relations Officer, Mr Haslett, the Scottish Secretary, Dr Craig the Metropolitan Regional Secretary, Dr Gibson, and also for the 'genius of the Plymouth Meeting,' Mr Mayne Only the fact that most of those present were due at the civic reception at the Guildhall at an early hour stemmed the flow of oratory

SUPPLEMENTARY REPORT OF COUNCIL HONG KONG BRANCH

The paragraph under the heading of Hong Kong in the Supplementary Report of Council (*Supplement* June 18, p 378) should have stated that the B M A activities have been quiet during the year owing to the heavy work undertaken by medical practitioners in connexion with cholera *typhoid* [not typhus] etc

ANNUAL EXHIBITION AT PLYMOUTH

SECOND NOTICE

[The preliminary article on the Exhibition appeared in the SUPPLEMENT of July 9 (p 30)]

The Drill Hall at Millbay which housed the Exhibition and the Reception Room may be barn like in its exterior but commercial art made it surprisingly attractive within In the old days when the technique of showmanship was less well understood the Exhibition may well have been an austere and even grim feature of the Annual Meeting but now almost every one of its eighty or a hundred stands offers some beguilement to the eye A number of stands also appealed to the taste such were Cadbury's with their cocoa Gaymer's with their cyder the HAG caffein free coffee and the various displays of tonic waters —Ingram and Royle Schweppes Alexander Riddle and Co and Rayner and Co Czechoslovakia the storm centre of Europe had a special stand drawing attention to the way in which Nature has endowed it with six hundred mineral springs and the British Health Resorts Association a newcomer to the Exhibition produced photographic evidence of the charms of the coast and inland resorts of this country

Newcomers

A number of the exhibitors were newcomers to the Exhibition In the preliminary article we mentioned that there were being shown for the first time the standardized preparations of the British Cod liver Oil Producers (Hull) Ltd the footwear of Dowie and Marshall (an old firm on whose stand was an enlarged reproduction of a letter proving that in his day they provided foot comfort for the sage of Chelsea) and the homogenized foods for babies prepared by Libby McNeill and Libby Among others exhibiting for the first time was the Chartered Society of Massage and Medical Gymnastics with demonstrations and film showings The Vernon Spencer hearing aids principally in a three-valve model supplied in two forms for the user's convenience and surprisingly small and light in weight were fresh to the Exhibition as also was the exhibit of Tampax Ltd—a long fibred surgical cotton sterilized and highly compressed for hygienic purposes during menstruation The stand of S Maw Son and Sons was described in the earlier notice but a later inclusion here which was of special interest to visitors was the Bragg Paul pulsator Other new exhibitors were the Automobile Association and Pickford's Travel Service and the electricity and gas undertakings of Plymouth

Surgical Appliances

The Holborn Surgical Instrument Company showed three constructions which have recently been described and illustrated in the *Journal* The first was a simple traction table for hip-nailing operations (October 16 1937 p 751) the second an improved ear syringe and trough (December 18 1937 p 1226) and the third an instrument devised for the special purpose of induction of labour by the Drew Smythe catheter method (April 16 1938 p 848) The Genito Urinary Manufacturing Company gave prominence to instruments for chest surgery which also have at various times been noticed in the *Journal* Their Brompton Hospital models of operating and instrument tables were again shown and they had a full range of cystoscopes and cysto urethroscopes bearing the names of a dozen well known surgeons The John Weiss and Son exhibit was divided into two sections one of them occupied with surgical instruments in general especially the smaller patterns and the other with ophthalmic instruments among which a new model of the Schiotz tonometer and of Cruise's repositor were to be noted

The makers of apparatus for the ophthalmologist were ingenious as ever Theodore Hamblin in addition to sets of contact lenses had a comprehensive section devoted to apparatus for orthoptic training and muscle testing Attention was specially drawn to the strabismuscope Melson Wingate also had a fine display of ophthalmological instruments with ophthalmoscopes giving a fundus view completely free from shadow also a range of goggles and eyewear for every purpose

Short and Mason Ltd in addition to their well known sphygmomanometer and their thermographs (or recording thermometers) showed their passive vascular exerciser which was described in the account of the Belfast Exhibition last year A portable *x* ray installation—the whole equipment fitting into two canvas cases weighing altogether forty nine pounds—was shown by Kohl's Scientific Instruments Hanovia Ltd had their special sun lamps in operation and in a graphic exhibit with models and photographs showed the progress of the manufacture of their lamp from the original block of quartz

Supports Dressings, Ligatures, Beds

The Camp surgical supports are a well known feature of successive Exhibitions They were shown as constructed to post operative maternity and post natal use and also for use in general practice The supports are both rigid and adaptable easy in manipulation and based on anatomical principles H E Curtis and Son also exhibited their wide range of abdominal appliances including belts corsets and trusses for hernia The patterns all appeared excellent

Elastoplast adhesive bandages and plasters were exhibited by T J Smith and Nephew Ltd The doctor's elastoplast set is a metal case containing about one hundred dressings or dressing strips of various shapes and sizes Cuxson Gerrard and Co showed various plaster bandages and surgical plasters including a new type of plaster of Paris bandage the feature of which is its rapid absorption of moisture and non detachment of the plaster from the bandage material when dipped in water so that a firm and perfect cast is formed This firm also showed sterilized ligatures as did the ligature department of the London Hospital whose product is well known

The frequency of road accidents has led Thermega Ltd to devise a specially strengthened electric blanket for ambulance use This can if necessary be transferred from the ambulance to the hospital bed and plugged up again to maintain the warmth and avoid so far as possible the cold following the shock until the patient has received attention The Denver Chemical Manufacturing Company again showed their antiphlogistine dressings a familiar feature at successive Exhibitions Hoskins and Sewell once more demonstrated the science of bed making and an inspection of their various devices for comfort left one wondering why seeing that one third of the normal life is passed in bed so little attention has been given until recent years to making the bed fit the sleeper

Pharmaceutical and Biological Products

Among the new products at the stand of Boots Pure Drug Company were gastomag (magnesium trisilicate) for the treatment of hyperacidity and rusven (Russell's viper venom) a powerful blood coagulant for local application in the control of external bleeding The sulphanilamide of this firm's manufacture was shown also supersan a non-poisonous and non irritant general antiseptic Attention was drawn to the range of sex hormone preparations

Of the Burroughs Wellcome display we gave some account in an earlier notice but mention should be made of the diphtheria antitoxin globulins which combine the advantage of increased concentration (4 000 Ehrlich units or more per c.cm.) with reduced protein content A noteworthy introduction was a calcium mandelate compound for use in urinary tract infections It lacks the

disagreeable taste characteristic of sodium or ammonium mandelate, and has a ready miscibility

The well-known Bayer products were again shown, and the firm, who have made many pioneer introductions in the field of chemotherapy, staged an effective exhibit illustrating fifty years of Bayer progress Among the new preparations was "bioferol," based on haemoglobin and liver extract and "elityran" a new thyroid product An interesting display was made by the Glaxo Laboratories, in which their 'examen liver extract shown for the first time last year, was again prominent A series of dissolved vaccines prepared according to a new technique developed in the laboratories was shown also a number of vitamin preparations, as well as the firm's ostocalcium tablets, which have lately been improved both in flavour and friability and increased in calcium content

The stand of Eli Lilly and Company was interesting for its wide range of high quality products including on the pharmaceutical side a crystalline material isolated from ergot, also a liver extract consisting of the fraction of liver sometimes spoken of as fraction G offered in powdered form for oral administration and in solution for intramuscular injection One new feature at the stand of Roche Products, Ltd, was 'nestrovite a preparation of vitamins issued as emulsion and as tablets the result of prolonged researches undertaken to provide the four indispensable vitamins (A B_1, C, and D) in a form both pleasant to take and medicinally reliable Pharmaceutical Specialties (May & Baker) showed two sulphanilamide products, "soluseptasine' for injection and 'prosepta sine for oral administration Another preparation shown here was "vinesthene, an inhalation anaesthetic for minor operations requiring a short but profound narcosis

A wide range of preparations was shown by Continental Laboratories, Ltd, including a 'serenol, which contains no barbiturate A firm boasting a history of over 100 years, C J Hewlett and Son had a very modern exhibit of what might be called the old-fashioned pharmacy with creams, ointments, lotions, and so forth A feature was made of P A B S (Hewlett's), under which title the firm has introduced its own brand of para-aminobenzene-sulphonamide W R Warner and Co again showed their "veracolate," a compound containing bile salts, with cascara, phenolphthalein, and a minute amount of capsicum Attention was also drawn to their haemorrhoidal suppositories for local emollient and protective action in inflammatory conditions of the ano rectal region Anadin, Ltd, and Bisodol, Ltd, shared a stand devoted to their respective preparations, the one an anodyne tablet and the other a digestant consisting of a number of ingredients in finely divided form Kaylene Ltd, exhibited their colloidal kaolin and its derivatives, one of these being "carbokaylene," offered as combining the detoxicating action of kaylene with the properties of highly activated vegetable charcoal

Books and Pamphlets

The bookstands as always afforded a pleasant relief The Oxford University Press had an excellent selection of their own publications and those of the Clarendon Press and the Presses of American universities One work was the second edition of Barrington Ward's *Abdominal Surgery of Children* and another the tenth edition of the *Manual of Bacteriology* by Muir and Ritchie Baillière, Tindall and Cox showed a large number of recent medical books published in this country and in America by various firms Other publishers stands were mentioned in the preliminary notice

The British Medical Association showed, in addition to the *British Medical Journal* and the special journals, the various publications it has issued, including the *Doctors Cookery Book* the reports of the Association special committees, and the various "grey books outlining Association policy The British Medical Bureau and the Medical Insurance Agency each had a stand at which their staffs were available for consultation, and the Agency had also enlisted the services of an expert automobile engineer, prepared to give advice on car problems, and a banking official for information and counsel on investment and similar matters The Exhibition was fully up to the standard of previous years, and it was a pity if the many diversions of Annual Meeting week in Plymouth prevented some visitors from giving it the attention it deserved

THE B M A AT TORQUAY

CIVIC DINNER

On the last Friday of the Annual Meeting the Mayor and Corporation of Torquay entertained a large number of the principal officers and delegates of the British Medical Association at dinner at the Imperial Hotel Dr Colin Lindsay President of the Association, Lord Burghley President of the Amateur Athletic Association, Sir Kaye Le Fleming Chairman of Council, and Dr G C Anderson, Secretary were among those present

Proposing the toast of the British Medical Association, the MAYOR (Alderman the Rev I Pugh) said he had followed with interest the deliberations at Plymouth which he was sure had been as profitable as on previous occasions He referred to the growth of the Association since 1832 There were he said many aspects of health which had shown vast changes during the past century, and the future was bright with the prospect of further progress particularly in the prevention of disease His work in life had brought him on many occasions into contact with medical men, and he esteemed the family doctor as the invaluable friend and adviser of all But the country owed a great debt to doctors for work outside their professional duties in philanthropical organizations, in literature, in local government, and in Parliament

Dr COLIN LINDSAY, responding, said the meeting had been an unqualified success and he acknowledged the hospitality the Association had received from all the South-West of England The benefit to members of the profession of these meetings in perfect harmony, upon which they could look back with pleasure, was incalculable

AIMS OF THE NATIONAL FITNESS COUNCIL

The toast of the Physical Fitness Campaign was proposed by the DEPUTY MAYOR (Colonel R Ward, *M C*), who referred to the changes in England which had followed the industrial revolution These changes, he said, together with the increasing leisure of the people, had focused attention on the problem of physical culture, which each part of the world was trying to solve in its own particular way, the British way being that of voluntary effort He coupled with his toast the name of Lord Burghley, who had upheld the honour of England on many Olympic fields and was not only an athlete but a leader

Lord BURGHLEY in reply, said the National Fitness Council was concerned especially with young persons after they had left school and gone into industry The work of the council was entrusted to people with experience in sport and in professional and social organizations One part was concerned with applications for grants to assist in providing swimming baths, community centres, playing fields, clubs, gymnasia, camping sites youth hostels, etc Applications at present amounted to 3½ million pounds, of which grants of £400,000 had been made The council also aimed at maintaining the tradition of voluntary service and helping existing voluntary organizations and co-ordinating work A college had already been planned for teaching and for research Another part of the council's work was propaganda, and in this they were really selling ideals rather than goods, it demanded the willing co operation of individual young men and women and it was breaking new ground He believed it would

be successful because people now realized that to be healthy was to be happy and because the State was only the individual written larger and the efficiency of each person in his actual work was a duty to the community

Physical Fitness Display

A display of physical fitness was given in the afternoon at Torquay in connexion with the meeting of the Section of Physical Medicine and Physical Education and was attended by some 500 spectators The first part was a demonstration by Plymouth pupils of the Margaret Morris Institute led by Miss Rhoda Luxton the aims of the institute were briefly described by a member of the London staff Miss Betty Simpson who also controlled the display and explained the various evolutions including the attention given to posture walking rhythm and graceful natural movements The second part was a demonstration by thirty recruits from the Physical Development Depot by permission of the Army Council and arranged by Major General H H A Emerson D S O M B The recruits wore coloured shorts red or blue which bore a letter of the alphabet the men were paired and the corresponding letter on red and blue showed the difference between an entrant to the Depot and one who had spent some time there Each spectator received a list of the recruits giving the age weight height and chest measurements of each man on arrival at the Depot and the present weight and chest measurements of the senior recruits this was accompanied by some general information including points of interest from their medical history Colonel Proctor speaking at a microphone explained that these were not picked men but just a routine sample had the display taken place a month previously he said there would have been an even greater contrast Some of the recruits who had had their tonsils removed at school seemed to remain malnourished but showed progress after reaching the Depot Each was studied individually and there was a full medical overhaul with specialist facilities whenever this was indicated All the exercises were undertaken so far as possible in the open air and as gymnasium apparatus could not be taken out into the field these were improvised and very successfully with thick bamboo canes

It was a most interesting and instructive demonstration of what is being done for these men All who were privileged to watch it must have been impressed with the contrast in health and physique between the entrants and the senior recruits

POSTGRADUATE NEWS

The Fellowship of Medicine announces that a course in physiology in preparation for the Primary F R C S examination will take place on Mondays Wednesdays and Fridays at 5·30 p m from August 15 to November 4 Instruction will consist of lecture demonstrations and a paper of questions is set each week The following courses have been arranged rheumatism and hydrotherapy at Royal Bath Hospital Harrogate on September 16 17 and 18 (morning) ophthalmology at Royal Westminster Ophthalmic Hospital September 24 and 25 plastic surgery September 14 and 15 children's diseases (for D C H candidates) at Infants Hospital September 19 to 24 proctology at Gordon Hospital September 26 to 30 diseases of the heart and chest (for M R C P candidates) at Royal Chest Hospital Mondays Wednesdays and Fridays at 8 p m from September 12 to 30 Courses are open only to members and associates of the Fellowship of Medicine 1 Wimpole Street W 1

WEEKLY POSTGRADUATE DIARY

EDINBURGH POSTGRADUATE LECTURES.—At Edinburgh Royal Infirmary *Thurs* 4·30 p m Prof A J Clark F R S Therapeutic Actions of Barbiturates

THE INSURANCE MEDICAL SERVICE WEEK BY WEEK

Vaccination

A question has been raised by a practitioner as to his liability to perform vaccination as part of medical benefit in a case in which he had recommended the patient's admission to an orthopaedic hospital and it is a requirement of the hospital that all patients must be vaccinated before admission The Panel Committee for the area has been consulted and has expressed the view that in the circumstances vaccination comes within the scope of medical benefit The Panel Committee in this case has presumably drawn a distinction between a routine requirement by the hospital and a similar requirement on the part of a prospective employer In the latter case where a person is vaccinated solely in order to satisfy the prospective employer's requirements the insurance practitioner would be justified in charging a fee

The general position with regard to vaccination was laid down by the Department many years ago and is quoted on page 64 of *Medical Insurance Practice* as follows

It is for the practitioner to decide in the first instance whether any particular form of treatment preventive or otherwise is in the interests of the patient's health but in general he would be expected to give the same treatment that he would advise one of his private patients to undergo in similar circumstances In the view of the Minister the fact that the treatment could be obtained from a public vaccinator would not in itself justify an insurance practitioner refusing to vaccinate one of his insured patients who desired him to perform the operation

Practitioners' Expenses in Attending a Hearing

It would appear from a recent report that the expenses of a practitioner attending before a medical service subcommittee in those rare instances where such expenses are claimed are not paid on a very generous basis A subcommittee reported that it had received a communication from the doctor concerned claiming 10s 6d for himself and 10s 6d for his deputy The cost of travelling by rail from the residence of each of the practitioners and making the return journey was apparently 10d and the committee resolved that the sum of 10d should be paid to each of the practitioners concerned

Practitioners' Lists

Statistics are not ordinarily to be found in this column but the following extracts from the annual reports of the London and Glasgow Insurance Committees may be of general interest

THE LONDON MEDICAL LIST

The number of practitioners admitted to the list during the year was 196 and the names of 215 practitioners were withdrawn during the same period The figures appended indicate the number of practitioners in the insurance medical service at December 31 over a series of years

1913 1 462 *1918* 1 427 1923 1 650 1928 2 092 19 3 2 178 1934 2 174 1935 2 136 1936 2 162 1937 2 155

The Allocation Scheme provides that a practitioner carrying on practice otherwise than in partnership shall not be permitted to have more than 2 500 insured persons on his list In the case of two or more insurance practitioners carrying on practice in partnership the number on the list of any one of such practitioners shall not exceed 3 000 and the average of the numbers on the lists of both or all the partners shall not exceed 2 500

An insurance practitioner or partnership of insurance practitioners employing one or more assistants may be permitted a higher limit provided that the additional number shall not exceed 1 500 in respect of each assistant

In the following table particulars are given of the sizes of the lists of insurance practitioners It should be borne in mind that assistants do not have lists of their own and that in the larger lists the principal would have an assistant In other cases a practitioner in partnership (with or without an

assistant) may have a larger number than the average by reason of another partner having less than the average

Insured Persons on List 1937

0	58	2 501–2 750	51
1– 250	598	2 751–3,000	19
251– 500	206	3,001–3 250	14

2 251–2 500	67	Total	2 008

'Average number of insured persons per list (excluding assistants and limited lists) 1937 993 average per practitioner 1937, 866

GLASGOW MEDICAL LIST

'The number of practitioners on the medical list of the committee on January 1 1938 was 483 (421 men and 62 women), being a decrease during the year of 14 During the year 31 practitioners retired from the medical list and 9 died The number of additions to the list was 26 Of the 483 practitioners on the list 367 are resident within and 116 outwith the city These 483 practitioners have 667 consulting rooms—562 in and 105 outwith this area Ten practitioners have notified the committee that they practise homoeopathy The number of medical partnerships in the area is 67 affecting 137 practitioners Sixty-five are partnerships of two practitioners one of three practitioners and one partnership of four practitioners

There are 18 practitioners required to employ assistants owing to the number of insured persons on their lists exceeding 2 000 the number allowed under the provisions of the Allocation Scheme to be on the list of a single handed practitioner There are also 32 other practitioners who although not required by the Allocation Scheme employ assistants

The following statement shows the number of insured persons on the lists of practitioners

Lieutenant Colonel N S Sodhi M C to be Colonel

Lieutenant Colonel S S Vazifdar has retired from the Service

The services of Major H W Mulligan have been placed at the disposal of the Government of Madras for appointment as Director, Pasteur Institute Coonoor

Lieutenant (on probation) A F Goode has relinquished his probationary appointment

Correspondence

WANDSWORTH AND A STATE MEDICAL SERVICE

SIR—I have been away from home since the Plymouth meeting and have not yet seen any *Journal* since then I am now told that you have reported quite correctly, that in my remarks on motions by Glasgow and Kensington on the subject of a State medical service I associated the Wandsworth Division with these in their attitude towards such a service I am very glad to know that you have received a correction from Wandsworth The error was entirely mine and was inexcusable No doubt I owe an apology both to Wandsworth and to Kensington for having mistaken the constituency of one of the latter's representatives But to Wandsworth and its representatives my apology cannot be too complete To have attributed to them such an opinion was an almost unforgivable error I can only hope that this acknowledgment may be held to mitigate the offence At any rate I rejoice to know that only two Divisions and not three have been led astray—I hope only temporarily—by the uncertain connotation which still attaches to the phrase 'a State medical service'—I am etc,

Truro, Cornwall, August 3 HENRY B BRACKENBURY

NIGHT DUTY UNDER A GENERAL MEDICAL SERVICE

SIR—There is one point I would like to raise with regard to the proposed national health service It seems curious to me that in discussing a national health service the position of the general practitioner in terms of other workers has not been considered On one point only I as a general practitioner, view this extended service with horror, and that is night work It must be realized that the millions of people to be included in this scheme will no longer have the bogy of an extra fee for night work and also that these people not being the workers who are the healthiest members of the community will be drawn from the aged the married women and the children, who require a great deal more attention than the workers I must make it clear that while I wish to be paid adequately for my services I do not wish to gain by these penalizing night fees I do however wish to give up night work and live as every other worker with certain hours on duty and certain hours off I wish to work so many hours a week—the same as anyone else Should the general practitioner's Utopia ever be created without night-work, I hope

it will be made illegal (as in the case of the Shops Act) for a doctor on day duty to work after hours. Otherwise kind friends would ask us to go at night as a special favour and soon things would be *in statu quo*. I suppose there are about 2,000 people to every general practitioner in this country and if each should call the doctor at night only once a year the latter would have nearly forty night calls a week. This is not the case at present but the slightest laxity in custom can easily lead to a doctor's life becoming impossible.

How could this be dealt with? In districts where the population is sufficiently large young doctors could be employed on permanent night duty. They would be regarded in much the same light as house physicians and house surgeons and would take up the appointment to gain experience or while they were reading for an examination. They would only spend their early years in this work. There must be some work for these men and with the increase in the number and size of partnerships the number of locumtenents required will become less and less. They would not have a great deal of work to do because the public knowing its own doctor to be unavailable at night would send for him in good time on many more occasions than it does at present. These night doctors could deal with the work of many practices. They would see the patient at night and hand him over at 9 a.m. the next day to the appropriate doctor. The payment of these men could be made with little or no loss to the doctors concerned—a small deduction from the capitation fee and a payment for each private case. This expense could be offset by the doctors since it would no longer be necessary for him to live in the town where rents and rates are high and it would no longer be necessary to keep extra maids so that the house should not be left day or night. He could live in the country and surely no man needs peace, fresh air and sunshine more. He would have a small office in the town. Finally I would suggest that the doctors' hours should be the same as those observed in shops.—I am, etc.

Reading, August 2. STANLEY C. ALCOCK.

Diary of Central Meetings

SEPTEMBER

22 Thurs. Insurance Acts Committee, 11.30 a.m.

Group of Orthopaedic Surgeons of the Association

Notice is hereby given of the formation by the Council of a Group of Orthopaedic Surgeons which shall be composed of all those members of the Association who are predominantly engaged in the practice of orthopaedic surgery. Members of the Association who claim to conform to this definition are requested to apply to the Secretary, B.M.A. House, Tavistock Square, W.C.1, not later than September 17, 1938, for a form of application for membership of the Group. The first general meeting of the Group will be held at a date to be subsequently announced in the *Supplement*.

G. C. ANDERSON,
Secretary.

August 13.

B.M.A. CHARITIES TRUST FUND

The following subscriptions and donations were received by the B.M.A. Charities Trust Fund during the period January 1 to April 30, 1938, for allocation to medical charities at the discretion of the Trustees of the Fund (the Council of the Association):

£100—Derbyshire Panel Committee. Portsmouth Division (proceeds of dance). York Local Medical and Panel Committee.
£77 17s. 1d.—Southport Division (proceeds of annual dance held by ladies of the Division).
£60—Cardiff Division (proceeds of dinner and dance).
£37 16s. 5d.—South West Essex Division (proceeds of dance).
£15 15s.—H. M. Davies.
£12 5s. 10d.—Lindsey Local Medical and Panel Committee.
£10 10s.—H. M. Halliday.
£10—Cuthbess Panel Committee. J. B. Lowe.
£8 8s.—North Middlesex Division.
£5 15s. 6d.—W. E. C. Wynne. M. J. Wynne.
£5 5s.—Anon. A. T. Bleach. A. H. Burgess. D. R. Clarke. A. F. Dickson. J. Husband Clutton. G. S. Lund. P. Macdonald. R. G. McGowan. R. L. Newell. West Middlesex Division (proceeds of dance). C. F. Williamson.
£5—E. Duff Gray. J. Humphrey Owen. J. A. Vaughan.
£4 4s.—The Hon. W. S. Maclay.
£3 3s. 10d.—A. C. S. Waters. J. A. Hislop and W. J. Frith.
£3—Irene F. Callender.
£3 10s.—North East Ulster Division.
£3 8s. 6d.—W. S. Ormiston.
£3 6s. 8d.—Warrington Division.
£3 3s.—R. T. Brain. G. L. Buckley. P. C. Colls. J. G. Curnock. R. O. Eades. C. C. Easterbrook. Captain G. K. Graham. E. Gresham. F. E. Ingall. G. L. Keynes. J. H. Paul. S. G. Platts. Major E. Underhill.
£3 1s. 6d.—A. Bernard and W. A. D. Lawson.
£3—Miss Ruth H. Western.
£2 19s. 1d.—J. W. S. Wilson and J. I. Williams.
£2 13s. 6d.—C. H. Gunson.
£2 10s.—Surgeon Lieutenant J. G. More Nisbet.
£2 4s. 9d.—S. J. Watson.

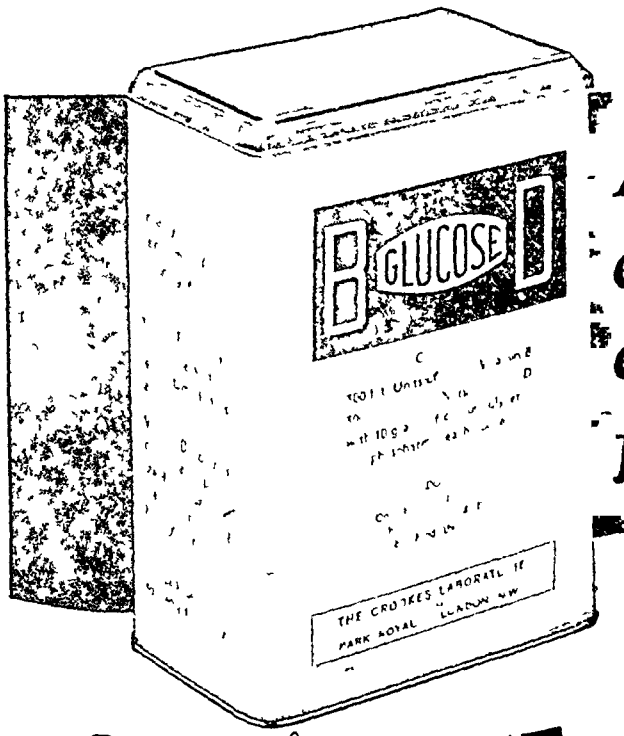
SALTAIR SURGICAL SERVICE

Guarantee
"We guarantee to alter exchange or accept the return of any appliance without cost ordered by the Medical Profession if not found Suitable within fourteen days from date of supply"
Salt and Son Ltd.

SALT'S VISCEROPTOSIS BELT

POSITIVE SUPPORT FOR THE ENTIRE VISCERA

● Salt's Visceroptosis Belt not only affords uplift to the lower abdomen it actually provides comfortable and complete support for the **whole of the viscera**



For the foregoing reason this particular Belt is also extensively used for post-operative cases where support above the umbilicus is required

Its consistent efficiency obviates the necessity for corsets in many cases

Upon request we shall be pleased to send the latest edition of Salt's Corset and Belt Book to any medical man This book gives full details and Measure/Order Forms for all SALTAIR individually-made Appliances

SURGICAL SERVICE SALTAIR

SALT & SON LTD BIRMINGHAM 2

A pleasant easily assimilable energising food....

Crookes' Glucose B.D.

MAY BE TAKEN IN FRUIT JUICE, FOOD OR TEA

Each ounce of Crookes' Glucose B D contains—

Vitamin B 1	300 Int Units
Vitamin D 3 (Natural)	300 Int Units
Calcium Glycerophosphate	10 Grains

VITAMIN B 1

to stimulate the appetite, render more efficient the digestion of food in the intestine, assure normal growth and energy in children and correct lassitude, nervous symptoms and poor appetite in adults

VITAMIN D

to promote normal growth, bone and teeth formation in children and in later life to correct Calcium and phosphorus metabolism due to a lowering of the phosphorus content of the body set up by faulty absorption

CALCIUM GLYCEROPHOSPHATE

in conjunction with Vitamin D ensures maintenance of the correct Calcium-Phosphorus balance

GLUCOSE

—the most readily available of all energising food-stuffs—present in its finest medicinal form

normal individuals however refused to react and they usually disliked the sea and were better elsewhere Sea bathing itself if followed by a glowing feeling was most beneficial but it should not be overdone in the early stages and by those whose reaction was poor A bathe was followed with advantage by warmth friction and sunlight Sir Henry preferred to have the very sick and children under 5 years for an initial period at Alton before moving them to Hayling Island because if they were over stimulated their appetite might increase but their digestion could not cope with the food They lost weight became irritable and often ran a slight fever

Dr J INGLIS CAMERON (Glasgow) stressed the psychological aspect and demonstrated the value of elliptical movements to produce suppleness rather than strength Surgeon Lieutenant Commander L J CORBETT R N (Portsmouth) stated that in the Navy the medical officer was paid to keep men fit Not enough stress was laid on the correct starting position for exercises In his experience javelin throwing was the most efficacious method of producing the perfect female figure and poise He was astonished at the rapid improvement in the physique of recruits under training and the increase in exercise tolerance and vital capacity Ten minutes in the open air was the routine spell of physical training but medical supervision and graduation of exercise were most essential Profesor W P KENNEDY (Baghdad) pleaded for education of the public on the working of the body and in simple physiology

Dr B V DUNN (Torquay) had noticed more obstetrical difficulties in the extremely athletic mother than in the average woman Dr DOREEN NIXON (Bristol) said she found lectures on personal hygiene were more popular than those on general hygiene Cold bathing was of no harm during menstruation if followed by a glowing reaction Dr K R C HALLOWES (Torquay) stressed the importance of making patients feel they were improving, and hence the value of occupational therapy in conjunction with physiotherapy He advised women not to bathe in the sea the day before and the first day after menstruation Sea air was of value without sun and therefore shelters were to be recommended

Dr A R NELIGAN (Droitwich) mentioned the importance of posture training and the fostering of pride in position and use of the body He advocated the use of a badge in schools to mark those who had attained good poise Dr A E CARVER (Torquay) emphasized the necessity for the individual having a will to be fit this needed gradual education He believed that a custom of regular medical overhaul would destroy the lay fear of this ordeal He advocated two meals a day for many older people

Co-operation in Public Health

With Professor CHARLES SINGER President in the chair Sir WILLIAM WILLCOX opened a discussion on Co operation in Public Health Administration His paper was in part a recapitulation of his arguments in opening a similar discussion recently in the Kensington Division (*Supplement* July 2 p 6) The medical officer he said must be supreme but he needed the close co operation not only of specialist experts but of the general practitioners of his district Co-operation would be facilitated by the appointment of a consultative medical advisory committee consisting of representatives of the local practitioners the medical officer of health to be chairman At post natal child welfare and immunization centres to take these as examples there were many opportunities for the general practitioner to be of enormous help and it was important that practitioners consultants as well as general practitioners should equip themselves for their responsibilities With regard to the consultation on hospital services as laid down by Section 13 of the Local Government Act 1929 he drew attention to the lead given by London Manchester and Liverpool Everything possible should be done to close the gulf which had existed between municipal and voluntary hospitals

Position of the M O H

Professor R M F PICKEN (University of Wales) said that if the issue were simply co operation between medical officers and private practitioners it would be easily adjusted They were all trained in the same school spoke the same language and tended to fraternize But the officer was part of a machine which he must strive to make efficient If his authority determined that things were to be done in a certain way he must loyally see that that was done even though the method was not generally acceptable to his profession It was unthinkable that he should conspire with his medical colleagues to undermine the decisions of his council Parliament had placed on local authorities an increasing burden of clinical responsibility often the result of propaganda by the profession itself all of which was making it increasingly difficult to draw a clear cut line between the province of the medical officer and that of the general practitioner If medical benefit had covered dependants from the beginning some of the departmental activities might never have been necessary The atmosphere of suspicion created by these modern developments could be made less fiery by any means which would foster co operation between medical officers and the rest of the profession The most valuable of the existing advancements for such co operation was the interpenetration central and local between the executive bodies of the Association and the Society of Medical Officers of Health

The General Practitioner and Midwifery

Dr J A BROWN (Birmingham) said that it was not realized by medical officers of health and the authorities which employed them that every doctor working on a contract basis was an assistant medical officer The difference was that the medical officer as commonly understood aimed at individual health through communal health and the general practitioner at communal health through individual health The obvious machinery for local co-operation was the British Medical Association through the Divisions the boundaries of which were usually coterminous with those of the local authorities It would not be a difficult thing for the local authorities to hand over to the general practitioner all the purely medical work done for expectant mothers at the ante natal centre this work could be done at the surgery or at the patient home the welfare centre being available as a consultation clinic in difficult cases In return the general practitioner must be prepared to fill in gaps which might exist in his knowledge of ante natal and post natal care and to perfect and carry out an ante natal scheme in conjunction with and to the satisfaction of the medical officer of health The proper adviser for the expectant mother and the best attendant at confinement was the patient's own doctor

Co-operation in Practice

Dr G N GEBBIE (M O H Hull) gave instances of co operation in his locality Most of the members of his staff were members of the British Medical Association and he himself was on the council of the East Riding Branch In areas where co operation with the British Medical Association existed there was no need for the appointment of a special medical committee to deal with a sudden public health emergency The health administrator was now asking himself whether the passing of the *Physical Training and Recreation* Act did not inaugurate a new epoch In the past the endeavour had been to make healthy the unhealthy in the future it must be to make the healthy fully efficient This new phase meant a changed outlook for the public health administrator and for the general practitioner also Co-operation of the whole profession was essential if it was to lead as it should the movement towards positive health The public health administrator must realize that he was first and foremost a medical man and a member of a great profession The general practitioner although a member of one of the most individualistic of professions must envisage the community and not the individual patient as the unit.

Difficulties in Co-operation

SIR KAYE LE FLEMING (Chairman of Council) drew attention to some outstanding difficulties in bringing about co operation In his belief a large number of public health authorities did not know they had any power to co operate at all Many authorities failed to realize how deeply underlying many of their problems was a medical issue Some local health authorities were extremely unwilling to have doctors sitting on their committees Their members often knew really nothing about health they relied on their medical officer and did not mind exposing their ignorance to him but they did not want other medical men sitting with them Perhaps also they disbelieved that the general practitioner was in a position to supply them with information and help There were faults upon the general practitioners side also He would not apportion the blame for the lack of the spirit of co operation which prevailed The root cause was that the medical student in his education was never taught anything of his responsibilities towards members of his own profession He looked forward to the day when those responsible for the training of medical students would say to them, 'When you go out into practice you have no right to sit alone in your own little circle seeing how much money you can make by attending patients who are ill You will remember that you have duties to the profession as a whole to the public as a whole and to the State

DR PETER MACDONALD (York) did not share the pessimism of the last speaker Many of those who had been concerned for some time with the relations between the profession and representatives of the local authorities believed that the atmosphere of suspicion had practically disappeared so far as general practitioners and medical officers of health were concerned had largely disappeared as between the profession and the Ministry and was disappearing rapidly as regards the relations between the profession and the local authorities

DR J W BONE (Luton) said that he had spent a good deal of time trying to get established a scheme of pathological services in his locality with a laboratory in the hospital but after long discussions with the authorities they had insisted on a laboratory in the basement of the town hall In regard to maternity services the aim seemed to be to get nearly all the cases into maternity hospitals with whole time officers, with specialists perhaps coming from thirty or forty miles away while men who had spent their whole career doing midwifery had no place in the scheme Would it be deemed the acme of co operation for the private practitioner to commit suicide?

A Lay View

COUNCILLOR H M MEDLAND (Plymouth) a Vice President of the Section said that he felt as if he had come into a syndicalist society of people who believed in the profession running everything themselves In Plymouth on setting up a municipal hospital, they had been extremely anxious to get the co operation of everybody concerned Representatives of the medical committee of the voluntary hospitals said that they would be delighted to help which they did by asking the municipal hospital first to take all the chronic bronchitis cases then the very bad rheumatic cases then the cases of advanced cancer That was the sort of co operation they offered His experience of pathological departments was that it had never been possible to make them go until the public health committee had been induced to foot the bill by more than half In maternity and child welfare services the doctors had missed the boat He did not see why doctors should expect to be co opted on public health committees without going through the hurly-burly of popular election The voluntary hospitals would fail unless they had municipal assistance and if they took such contributions they must expect to concede representation on their management

DR T RUDDOCK-WEST (M O H Norfolk) said that in his area co operation was very much in evidence He himself knew practically every general practitioner Almost all the welfare work was done by general practitioners There was no difficulty about co option on committees He believed in continuity the same practitioner so far as possible should do the ante natal work and the maternity and child welfare work DR LETITIA FAIRFIELD said she had been an official throughout her career but never a bureaucrat The patient's welfare was the crucial test DR J BENNETT (Warrington) said that he had been eighteen years in the public health service but his bias was in favour of the general practitioner At the same time in working maternity and other schemes, practitioners were not always above reproach He instanced a maternity home intended for difficult cases but to which practitioners sent many normals

SIR WILLIAM WILLCOX in reply said that he was in favour of co option of medical men on subcommittees but not on the councils themselves for such seats they should run the gauntlet of popular election He hoped the outcome of the discussion would be that the Branches and Divisions would get into communication with medical officers of health in their different districts and talk the matter over as to how co operation could best be brought about Professor PICKEN also in reply said that while co operation was an admirable word so much time could be spent in trying to work out methods that the spirit of the thing faded away The solution of the whole problem would be found in that admirable document—'Proposals for a General Medical Service for the Nation

MR R R BLEWETT of St Day Cornwall addressed the Section on Some Medical and Social Changes in a Derelict Mining Area A report of his remarks and some comments thereon appeared in the *Journal* of August 6 (p 293)

SECTION OF OPHTHALMOLOGY

Friday July 22

Corneal Transplantation

With DR C B F TIVY (Plymouth) a Vice President in the chair MR J W TUDOR THOMAS (Cardiff) read a paper on corneal transplantation giving results of fifty six operations on forty-eight eyes a series extending over nearly eight years and showing 65·2 per cent of successes If only cases that could be regarded as favourable from the operative point of view were considered 92·3 per cent of successes were obtained Since 1936 he had used a modified technique and the results on a comparable basis were better all favourable cases were successes

SIR STEWART DUKE-ELDER and MR H CAIGER (Sheffield) expressed their gratification at the results and MR A RUCE GUNN related his personal experiences with one case of corneal grafting

Pathology of Glaucoma

The President SIR STEWART DUKE ELDER took the chair to introduce Professor K WESSELY of Munich who read a paper on some special problems in the pathology of glaucoma He drew attention to the difficulties in diagnosing glaucoma *in high myopia* The appearances of the disk in myopia tended to mask cupping the attenuated sclera interfered with tonometer readings and choroidal atrophy with the mapping out of field defects These difficulties could be overcome by stereoscopic ophthalmoscopy repeated tonometry and special care with perimetry He described in some detail thirty one cases of glaucoma in myopes, mostly of 10 to 20 D More important than the recognition of the fact that glaucoma occurs in myopes was the fact that myopic eyes were especially predisposed to it In anisometropia glaucoma tended to occur in the myopic eye only and there seemed to be a special predisposition in myopic eyes with aphakia He drew attention to a transient acute glaucoma frequently seen two to six weeks after operation for cataract in myopes and urged the sparing use of mydriatics in the post operative treatment of such cases Theoretically there was some basis for the view that high myopia was a kind of *buphthalmos* Another group of glaucomatous conditions that he discussed

was the rise of tension seen in haemorrhagic studies of the eye. The old view that the glaucoma was secondary was probably not valid. It was more likely that the two processes had a common factor.

The PRESIDENT emphasized the points brought out by Professor Wessely who he said had brought a wide philosophical outlook to the problems of glaucoma. Too much influenced by the teachings of Priestley Smith ophthalmologists tended to overlook glaucoma in myopes. It was well to recognize that glaucoma was not one disease but a symptom of a variety of conditions and that blockage of filtration was not the only cause. Professor A. J. BALLANTYNE (Glasgow) suggested that the glaucoma of high myopia might be secondary to chronic uveitis itself a part of the myopic process. Dr MARK GARDNER (Melbourne) gave the details of a case which supported the views of Professor Wessely as to the association of the glaucomatous processes with vascular disturbances. Mr W. S. BURR (Plymouth) had found that a glaucoma iridectomy prior to lens extraction in high myopia avoided the complications of glaucoma. In regard to glaucoma associated with arteriosclerosis he held that such patients were unsatisfactory subjects from the general point of view.

Contact Lenses

Mr A. RUGG GUNN read a paper on the Contact Lens Centre, its purpose and policy. He explained the workings of the centre which was now responsible for some of the finest work in this field. It was not run on any profit making basis; such surplus as was likely to be accumulated would be utilized to further the training of people for this work, for a Samaritan fund and to encourage further research. These activities were under the supervision of an advisory committee consisting of some of the leading figures in ophthalmology. Miss IDA MANN stressed the value of the centre as a research base. Others who took part in the discussion were Mr W. S. BURR (Plymouth), Mr J. M. BICKERTON, Dr MARK GARDNER (Melbourne), and Dr C. B. F. TIVY (Plymouth).

Miss IDA MANN showed a number of patients wearing contact lenses both of the Zeiss pattern and individually fitted. The patients illustrated the conditions for which such lenses could be used: high myopia, monocular aphakia, keratoconus, corneal scarring, and high hypermetropia. There was good tolerance in all cases; some patients wearing the lenses up to fourteen hours a day, and showing improvement in visual acuity over ordinary spectacles.

Vital Staining of the Fundus

Mr ARNOLD SORSBY in a paper on vital staining of the fundus gave an account of the experimental work that he and his colleagues had conducted to establish the clinical possibilities of vital staining in ophthalmoscopy. The difficulties that had to be overcome were the blood-brain barrier and the toxicity of vital dyes. When staining of the brain was obtained experimentally no retinal staining could be seen owing to the reduction of the dye to the leuco-base. In rabbits with retinal degeneration produced experimentally retinal staining was always present. The preliminary clinical use of this procedure had established its feasibility and had shown this to be possible in a variety of conditions of which the localization of holes and retinal detachment was an example. Mr J. W. TUDOR THOMAS (Cardiff) and Sir STEWART DUKE-ELDER asked about the possibility of avoiding general staining by using the dye locally. In reply Mr SORSBY stressed the difficulties and uncertainties yet to be overcome.

Mr A. L. CANDLER (Exeter) read a paper by himself and Mr N. L. CAPENER (Exeter) on the avian nictitating membrane. After briefly describing the anatomy and histology of this structure they showed that the membrane was protective and also that certain birds such as ducks and penguins completely closed the membranes when under water and saw clearly through them. Photographs taken through the membrane of ducks were shown. This profusely illustrated paper was discussed by the PRESIDENT, Mr A. RUGG GUNN, Mr R. W. PAYNE (Plymouth), and Mr J. M. BICKERTON.

EXHIBITIONS OF FILMS AND RADIOGRAPHS

A most interesting addition to the Scientific Sections at the Annual Meeting at Plymouth was a show of cinema films mainly in colour which was given on the afternoons of Wednesday, Thursday, and Friday, July 20, 21, and 22. The full list of films which were projected by Kodak, Ltd., with the name of the demonstrator was as follows: In the Section of Gynaecology and Obstetrics: Resuscitation of the Newborn, Dame Louise McIlroy. Section of Medicine: Parenteral Liver Therapy in Subacute Combined Degeneration of the Cord; Polyneuritis with Special Reference to Vitamin B, Dr. C. C. Lingley. Section of Pathology: Psittacosis Virus: A Study of Tissue Culture (With the late R. G. Canti), Dr. J. O. W. Bland. Section of Pharmacology: Variations to Anaesthetics in a Mouse Colony, Professor A. J. Clark. Section of Physiology: Difficulties of Posture and Equilibrium in Blind Children, Dr. Phyllis Kerridge. Section of Surgery: Surgery of the Heart, Mr. L. O'Shaughnessy; Sympathectomy for Hyperpiesis, Mr. A. Dickson Wright; Partial Thyroidectomy for Thyrotoxicosis, Mr. G. Armitage; Abdomino-perineal Resection of the Rectum, Mr. A. Lawrence Abel. There were also films on the Action of the Muscles of the Foot, Mr. C. Lambrinudi; Occupational Therapy in Rheumatoid Arthritis, Dr. Elizabeth Casson and Plaster Jacket for Sciatica, Mr. N. Capener.

Mr E. O. Goss, honorary radiographer to the Meeting, had also arranged an exhibition of radiographs and clinical photographs. Many of the photographs were in colour and were entirely his own work.

PSYCHOTHERAPY CONGRESS AT OXFORD

The following report of the tenth International Medical Congress for Psychotherapy held at Oxford from July 29 to August 2 is a continuation of that published last week at page 298.

Disorders of Adolescence

Dr EMANUEL MILLER opened the morning session on August 1 with a paper on the disorders of adolescence. This period was marked, he said, by an overflow of instinctual pressure where ego defences were weak or the development of a moral tyranny from within which was met by neurosis formation. Character traits might be hardened. The mental reactions might be petrified and the mind stay in a state of suspended animation. Society became a projection screen for the tragi-comedy of adolescent interpretation. The neurotic mechanisms were nearer to the surface than at other periods, clearer and more admixed with psychotic qualities. The problems arose out of the struggle of the maturation of functions that of the super-ego with the growing sexual and aggressive demands. Society must meet the aspirations which this phase of temporary disintegration tended to produce. Dr E. H. LARKIN suggested that psychotherapists tended wrongly to treat adolescence as being necessarily pathological. The attempt to get away from a primitive bigoted super-ego tyranny into the freer and more fruitful democracy of a religious system was not a pathological process. Dr LOWENFELD suggested that when the endocrine functions of puberty came into operation the whole primary system of the mind became recharged and the adolescent strove to express every part of it which had not yet been expressed and so to gain mastery of it. A varied society and a rich therapy could give him the material for this expression and enable him to adapt the primary material to the needs of his own personality and of the social life.

An Open Clinic for the Maladjusted

Dr IRA S. WILE (New York) explained the working of the Open Clinic for problems of juvenile behaviour. The child

and its parents took part in an open conference with the clinic officers and a large audience drawn from all classes and callings of society—the parents of the children attending the clinic, and interested persons The behaviour problem was thus regarded as a maladjustment between the child and his milieu The family was seen as part of the social organization and the discussion transferred the responsibility to the large group representative of society itself A new system of ethical values grew up from which everyone concerned would profit The Open Clinic served as a mouthpiece of society Emotional tensions were drained away from the child and its parents and an opportunity was given for effective suggestive therapeutics in the presence of the mass Dr VAN DER HOOP asked whether the psychic examination was like the clinical examination 'to the waist only' Dr WILE replied that it was total and that all sexual questions were brought fully into the light

Love, Maturation, and Monogamy

Dr VON HATTINGBERG speaking on love as a process of maturation said that love was an indispensable function in the development of the personality Its importance had increased with the increase of consciousness This method of development was one of the basic ideas of analytical psychology and the silence of the literature about it was remarkable It took place only step by step and needed intimate human contact with the sexual partner as a vital stimulation Love had the task of making good the harm done by hyperconsciousness It made bearable the unavoidable growing pains caused by consciousness and the inner conflict between the nameless groups of forces aroused by the love passion Love expressed the hidden repressed childish side of the personality and provided a kind of reserve for the expression of primitive tendencies The relationship of conscious individuals in marriage developed into an analytical situation The repeated upheavals provoked by the reciprocal inner disturbance of the partners could lead to the realization by each of his personality This possibility gave a psychological background to the ethical demand for an indissoluble monogamous marriage

Dr O H WOODCOCK mentioned the contribution of Adler to the subject he had regarded marriage as a constructive task demanding equality between the sexes and monogamy as indispensable for full maturation

Stage Fright

Dr F VOLGYESI (Hungary) in a paper on stage fright and neuroses in professional life said that this class of neuroses clearly demonstrated a long series of neurological and glandular reactions and interrelations It could involve organic causes or short circuiting within the insulation of the sympathetic system, congenital abnormalities and accidental factors It offered a particularly favourable field for hypnosis and suggestion In a study of over 25 000 cases he had gained an insight into the mechanism As Pavlov had shown every nervous irritation first excited isolated nerve tracts and centres but if energy were accumulated or the excitement were very intense it would irradiate adjacent centres and become general The whole body might ache with the generalized tension Professional neuroses primarily represented associative disturbances caused by psychological factors in the temporal and frontal lobes Therapy must aim at interrupting the subjective phobia leading to the feeling of panic and breaking the vicious circle at producing an intimate and confidential relationship with the patient and at training the patient to discipline himself by turning his attention from the fixed idea and opening other channels for the stored energy He must see his troubles in their true proportion and harmonize his neurotic feelings with the outer world

A paper by Professor ERWIN STRANSKY (Vienna) on the relationship of subordination and authority in psychotherapy was read in his absence Dr H NEUGARTEN (Germany) explained the phenomena of psychotherapeutic reorientation and religious rebirth

Psychotherapy in Organic Disease

Dr B STOKVIS (Holland) dealt with psychotherapy for patients with circulatory disease The circulatory system like every other somatic system he said had a psychological as well as a physical function Most sufferers from circulatory disorder needed psychotherapy especially if the physical condition were overlaid with neurosis or depended on spasm He described the use of the electromagnetic tensograph for measuring essential hypertonia continuously and showed the psychic factors in its causation Active relaxation and Schultz's autosuggestive methods were valuable but the important requirement was a good rapport between physician and patient

Dr A T M WILSON in an address on the psychogenic factor in haematemesis gave the results of a study of fifty cases of acute peptic ulcer or chronic peptic ulcer with complication Of fifty-eight haematemeses forty-five had been preceded by some gross alteration in the patient's life of a kind likely to produce emotional stress In ten of the remainder there was evidence of precedent gross emotional stress The resulting psychological tensions were such as to threaten security—independence or dependence Precocious and apparently successful assumption of adult responsibility had often been concerned in the development of their characteristic traits and strong primitive moral values Haemorrhage often relieved the tension for several days The selection of the gastric function as the site of the symptoms might result from similar tensions in very early phases of development Enjoyment and use of anxiety and a martyred attitude were common This might be resistant to psychotherapy but the ulcer producing conversion might be broken down without much difficulty The patient must first be helped to convince himself of the sequence of external and internal events

Dr D ANSAC (Yugoslavia) contributed a study of psychotherapeutic possibilities in organic disease illustrated by two cases The first patient a young woman suffering from a severe disseminated encephalomyelitis was treated by hypnosis for neurotic symptoms and extensive movements of the leg were obtained with and later without, hypnosis When the treatment was interrupted the symptoms became worse The second case was one of hemiplegia with motor aphasia in a rich man who at first made little progress but was later much improved by emulating the superior progress of a workman who suffered from a similar condition Psychic components were too seldom looked for and dealt with The effects of organic injury could often be overcome

Dr W BROWN said that such a trauma would certainly increase suggestibility Certain cases of disseminated sclerosis and paralysis responded to hypnosis with relaxation treatment. An organic neurological disturbance was always accompanied by a psychological overlap Self-understanding through analysis gave help but every case of organic trouble would benefit by autosuggestion and progressive relaxation

Dr CLIFFORD ALLEN tracing the relation of the psyche to the endocrine glands pointed out the reciprocal action of the psyche and the glandular system In his opinion all hypersecretory endocrine disease in which there was no neoplastic disease was psychogenic Similarly the glandular functions could be inhibited by psychic factors

Professor JUNG closed the conference by answering in detail a number of questions which had been submitted to him in writing During the conference the University of Oxford conferred upon Professor Jung an honorary doctorate of science and on his return in his robes to the congress hall delegates stood and applauded Dr H Crichton Miller said that their applause expressed their appreciation and that of Oxford and the world of his great services to psychotherapy

On July 30 the Vice Chancellor of the University Mr A D Lindsay held an evening reception in the Ashmolean Museum On the morning of Sunday July 31 delegates and their relatives went on an excursion to Henley and Wargrave and made a river trip in motor boats On Monday evening the Mayor and Mayoress of Oxford gave a dance in the Town Hall

THE NATIONAL HEALTH IN FIGURES

ANNUAL REPORT OF THE MINISTRY

In a foreword to the Annual Report of the Ministry of Health[1] Dr Walter Elliot compares conditions as they were a hundred years ago when Edwin Chadwick began his reforming work with what they are to-day The general death rate has been halved the infantile death rate reduced to one third the tuberculosis death rate to one sixth In 1838 over 1,200 persons per million died of typhoid over 1 000 per million of smallpox over 20 per million of cholera The typhoid death rate is now down to 5 per million and from smallpox and cholera no deaths were recorded in 1937 Dr Elliot adds We are only beginning to realize how much can be done even in the case of those who are at present considered normal and fit

Vital Statistics

But, after all this is the nineteenth annual report of the Ministry and the record of the post war era though less dramatic than that of a century is perhaps more encouraging Take 1921 as a convenient date The general death rate was then 11 3 it is now 9 3 The infant mortality has fallen during those years from 83 per thousand live births to 57 the tuberculosis mortality from 1 117 per thousand of the population to 0 657 The figures for Wales the subject of a separate section are slightly in advance of those for England—a general death rate of 10 5 an infant mortality rate of 63 and a tuberculosis death rate of 0 862

The report embodies the usual tables relating to tuberculosis venereal diseases enteric fever, and cancer The notifications of new cases of tuberculosis are slightly up both in England and in Wales A decrease in the incidence of syphilis but not of gonorrhoea is noted Despite the Croydon outbreak the notified cases of enteric fever fell from 2 490 in 1936 to 2,149 in 1937 but the first figure was swollen by the Bournemouth outbreak of that year The number of deaths from enteric was 206 a rate of 0 005 per thousand which is about the average of the last eight years The total number of deaths from cancer in England in 1937 was 66 965 the highest figure yet recorded—an increase of some three hundred on the previous year It is stated that plans are being worked out in 81 areas for co operation between local authorities and the radium centres at voluntary hospitals with a view to making the treatment at the centres more widely available The notifications of diphtheria, pneumonia dysentery, and puerperal pyrexia or sepsis are up on the year those of erysipelas and scarlet fever are down

Maternity Services

The Ministry expresses itself well satisfied with the result of its two pushes —the Fitter Britain exhibit at Glasgow and the National Health Campaign The full effect of the latter cannot yet be assessed but it is said to be reflected in the figures of attendances at infant welfare centres and ante natal clinics These figures for 1937 show a considerable increase though the campaign did not begin until the autumn of that year The children under 1 year of age attending the centres reached a number equalling 63 per cent of the total of notified births (as compared with 60 5 the previous year) while the percentage of expectant mothers attending the ante natal clinics reached 54 1, again a record figure (against 48 8 the year before) The maternal mortality in England fell to 3 11 per thousand births comparing with 3 6 in 1936 and 3 9 in 1935 The proportion ascribed to puerperal sepsis is 0.94 compared with 1 34 in 1936 In Wales the maternal mortality was 4 54 considerably higher than the English figure although a noteworthy reduction on the Welsh figures for the previous six years which have always been over 5 0 and in 19 reached 6 6

It is too soon again to estimate the effect of the Midwives Act but in the country generally the work of establishing a salaried service of fully qualified midwives available for attendance on mothers in their own homes at a cost commensurate with their means has been substantially achieved During the year 649 additional maternity beds (including ante natal beds) were provided by the local authorities and the number of municipal maternity homes was increased by three Consulting services enabling midwives to call in a doctor at need have been established by 340 authorities out of a total of 365 and mobile emergency units available for women who cannot safely be removed to hospital have been completed by 56 authorities while 184 have put into operation the service of home helps

Public Health and Hospital Policy

Ten years ago the Royal Commission on Local Government laid it down that medical officers of health should wherever possible be whole time officers in the public service and should not engage in private practice further that in areas where the duties were not sufficient to occupy a whole time officer the county council should be required to make proposals for the combination of areas for this purpose The present report says that the Ministry has taken every opportunity to urge local authorities to follow this course Arrangements have been formulated in all except nine of the counties in England and in certain instances the Ministry has not hesitated to use its power of requiring the formulation of a scheme which was more or less in default formulating it himself Just under half of the county districts of England are now served by officers who are restricted as to private practice and of the officers including temporary officers approved during the year under review 93 will not practise privately At the end of March last out of the total of just over 1 000 medical officers of health in England 425 did so engage

The report mentions that a survey of the whole of the hospital and institutional facilities of the country has been in progress Sir George Chrystal the Secretary of the Ministry, told the Press representatives at a reception at which he expounded the Annual Report that this survey had now been completed and was likely to yield most useful results not only in the event of war which was its primary purpose, but in the normal planning of institutional facilities

The report states that the appropriation as general hospitals under public health powers of the institutions taken over from the old boards of guardians is making progress although in the counties where there are special difficulties the progress is slow Out of the 109 hospitals with a total of 57 318 beds so far appropriated only 22 belong to the counties (excluding for this purpose the county of London) and half this number are in the metropolitan counties of Middlesex and Surrey It is hoped however that the time is not far distant when the majority of beds in local authority hospitals will be provided under public health powers In patient admissions to these hospitals are increasing by about 50 000 a year and out patient attendances (very largely in the nature of attendances for continuation treatment of patients previously admitted to the wards) increased by not far short of a quarter of a million Major surgical operations done at these hospitals and institutions numbered 131 000 an increase of 10 000 on the year One does not expect to find current controversy mirrored in a report of this description but co-operation between voluntary and local authority hospitals is declared to be growing—as a result sometimes of the setting up of committees for formal consultation in connexion with particular schemes at others of the establishment of joint consultative com-

[1] H M Stationery Office Cmd 5801 (5s net)

mittees aiming at a liaison of a more continuous character or, again of joint hospital boards such as have come into being in Manchester and in Oxford and district

National Health Insurance

The insurance practitioner comes in for his usual 'pat on the back' after he has been reminded of his kick downstairs (that is not the Ministry's expression) in the refusal of the Court of Inquiry to raise the capitation fee A review of the disciplinary proceedings says the report gives every reason for thinking that there has been no deterioration in the high standard of service reached by insurance doctors and chemists though with regard to the chemists to be sure, there is an increased number of cases (161 as compared with 119 the previous year) in which money has had to be withheld on account of breaches of the terms of service, mostly substantial inaccuracies in the dispensing of test prescriptions In only one case during the year was a representation made by an Insurance Committee that the continuance of a doctor on the medical list was likely to be prejudicial to the efficiency of the service, and even in this one instance the representation was later withdrawn In only 92 cases in England and 16 in Wales was remuneration withheld from practitioners on account of infringement of terms of service, and only in a very small number of these did the patient suffer from the doctor's negligence in attendance the majority of derelictions were failure to keep proper medical records or to furnish information required by regional medical officers or some non-observance of the medical certification rules The largest sum withheld (in two instances in England) was £50 A form of irregularity which the Welsh Board of Health views with grave concern is the issue of certificates of incapacity by a practitioner when he has not seen the patient In one case this was judged so seriously that a heavy fine, again £50, was imposed

The cases of excessive prescribing come into a different category The regional medical officers paid 861 visits to doctors whose prescribing appeared to call for explanation but in only six cases did the Minister feel it necessary to refer formally to Panel Committees the question whether the doctors' prescribing had imposed charges on the available funds in excess of what was reasonably necessary, and in all of them it was found that such excess had been imposed But altogether it is a wonderful record of absence of serious complaint, and it must be remembered that the insured population of England and Wales now numbers 17¾ million persons as compared with 11¼ million when National Health Insurance came in a quarter of a century ago Two developments during 1937 from which much is hoped are the extension of benefit to juvenile contributors—the 14–16 class—and the scheme for postgraduate study for insurance practitioners

Miscellaneous Items

There is much else in the Annual Report of the Ministry to make it one of the indispensable documents of the year for the social student There are sections dealing with the Ministry's action in respect to foods and drugs, with sanitary services, with public assistance, with housing and town planning On the subject of nutrition it is mentioned that quantitative surveys on family diets are being carried out on the recommendation of the Advisory Committee on Nutrition of which Lord Luke is chairman in half a dozen rural districts, and it is believed some valuable data will be collected to supplement the Ministry of Labour survey on family budgets A reflection of the National Health and Fitness Campaign may perhaps be found in the fact that the public open space purchased during the year measured 12,113 acres as compared with 9,059 the previous year, and that the loans sanctioned for public baths and swimming pools amounted to over a million pounds as compared with a little more than three-quarters of a million in 1936

Correspondence

Abortion and the Law

SIR,—Mr Alick Bourne's letter in the *Journal* of July 30 (p 254) clears a confusion that was in my mind at least Before the case was tried it seemed to me that Mr Bourne had acted for the sake of a cause thereby risking his professional reputation and his freedom When the case was tried the fight for a principle seemed to be dropped Instead the case turned on the jury's opinion as to whether or not Mr Bourne was justified in terminating a pregnancy in a certain child And now one understands from his letter that the real issue after all is a principle He is standing for a further definition of the present law to the end that abortion may be legally recognized not only when *there is a danger to life but also when* there is a serious danger to health I believe that there is a large body of moderate opinion in the profession that is opposed to the views set forth by Mr Bourne, and I would like to state an alternative case in the following terms

The law as it stands is satisfactory Abortion is legally recognized when life is in danger and this interpretation of the law has always been recognized and acted on It is in keeping with general medical practice for we doctors are primarily concerned with life and death In simple terms it is our duty and our object to preserve life Life is more important than health Many a life that has been saved from the jaws of death has afterwards been a good life, even though health has not been recovered In fact we do not take the prospect of health into account when we are trying to save a life

The very uncertainty of the law as it now stands is an advantage It places a great responsibility on the members of the medical profession and it leaves the decision as to the life or death of a foetus to their discretion There is no doubt that some of us on account of a lack of courage or for some other reason fail to maintain the high standard expected of us If a man falls below the standard of integrity that he has set himself he may find himself in a difficulty and he may be greatly worried But that the members of our profession have in the past generally acted well in the opinion both of their colleagues and of the people is proved to my mind by the fact that I remember no single occasion on which a doctor of good repute has had to stand his trial by jury for unlawfully terminating a pregnancy

If the law is to be altered by a further definition it will be no easier for us doctors to interpret than it is now There may be as little difference between one case and another as there is between the numbers 1, 2 and 3 A further definition will leave us with the same difficulty of judging between 2 3, and 4 And because the definition is more exact we shall be more likely to break the law in such action as we take

If, nevertheless the powers that be determine to frame a law that is more explicit, and so restrict both the freedom and responsibility of doctors, then I enter an earnest plea that they will keep to such primary considerations as life and death, whether it be in terms of a life that may be lost or a life that may be wrecked and refrain from introducing any phrase that suggests as a primary consideration a danger to health To qualify the danger by the word "serious" will make for difficulties The human heart *often quails on the brink of great adventures* The first month or two of a pregnancy may be the beginning of

the greatest adventure in a person's life and the addition of the word "serious," as suggested by Mr Bourne to qualify anticipated danger will lead to trouble.—I am etc,

London W 1 August 1 GEOFFREY EVANS

SIR,—To those who are in general agreement with your leading article on the Bourne trial it must seem that Dr F M R Walshe (*Journal* August 6 p 315) has misinterpreted the significance of the verdict. This is surely not affected in any way by the consideration to which he has directed his powerful polemics—namely whether and how far danger to health connotes danger to life. The important fact is that the verdict has clarified the position in law of the doctor who induces abortion on adequate grounds based upon danger to health. In the past the doctor who has carried out abortion for reasons other than danger to life as this is ordinarily understood—that is imminent or serious danger of death—has had no security in law. The verdict has now regularized a long standing medical practice. This is a different issue from that inherent in Dr Walshe's statement that to the aphorism life depends upon health the inference that danger to health necessarily connotes danger to life is a *non sequitur*.

While as I suggest this raises another and quite different issue it is perhaps relevant to point out that it would be difficult to cite influences which damage the health of the pregnant woman which do not at the same time connote not certain death but a real mortality risk. The essential medical problem remains as it was before the verdict—namely what measure of danger to health and life is an adequate indication? This like all such problems must remain a matter of discussion and in general will be determined by the average good sense of the profession. Neither is it easy to follow Dr Walshe in his view that the verdict should make this responsibility of the profession more difficult than it already is unless we admit that it may be exploited for illicit and extremist purposes. But this is not so much a medical as a sociological implication.

Finally, I wonder if we have been quite honest with ourselves in regard to the question of rape. It can hardly be in doubt that as the natural and indeed only court of appeal in circumstances of a heartrending nature the obstetrician is sometimes influenced by humanitarian considerations in performing abortion on such ravished children. The medical indications, though obvious may in themselves be less urgent than are found in many married women for whom such relief is refused. Are we not correct in assuming that the public conscience is prepared for a law to deal specifically with the tragic case of the raped child?—I am etc.

London W 12 August 8 JAMES YOUNG

SIR,—The recent case in which Mr A W Bourne was involved received wide publicity in the lay press and was also the subject of two leading articles in your issues of July 23 and 30. May I as a general practitioner be allowed to say that personally I cannot see that the position is any clearer to us now than it was before this case was heard. I have always been clear in my own mind as to what constituted genuine and perfectly legal grounds for terminating a pregnancy in a woman and such a course would never be entered upon without the concurrence at least of two other independent medical men of whom one at least should possess higher qualifications and greater experience in surgery or gynaecology. I imagine that all my colleagues and others in general practice are equally clear in this matter and in order to observe the law and strict medical etiquette would act as I have indicated.

It may be that in a really advanced stage of civilization the law will be different and that then no woman will be forced to become a mother unless she is willing and anxious so to be. Many advanced and serious thinkers in various fields hold this view to-day and I am very much inclined to it myself. However it is not for us medical men to make or to modify the laws of the land (apart from pressing for necessary reforms as citizens) but being in a special degree of relationship and trust with the State to observe the laws as we find them to-day.

We practitioners understand our duty and our position quite clearly we are not to connive at or to procure miscarriage simply because the patient desires to be rid of an inconvenient pregnancy. Mr Bourne's case was an exceptional one and I cannot see how it has clarified or defined our position any better at all. It is difficult to see that absolute consistency prevailed throughout the entire length of this case or that the same grounds were taken for clearing out this girl of 14½ all the way through. To be logical it should be remembered that in the earlier instance Mr Bourne accepted the case from Dr Joe Malleson and agreed to terminate pregnancy before he had even seen the child. It is impossible to resist the conclusion that Mr Bourne acted *ab initio* on purely sentimental moral and sympathetic grounds. But he did not stand his trial on those grounds at all. He defended himself on the grounds of it being medically desirable and necessary to terminate the girl's pregnancy—a very different matter. Every member of the jury would naturally wish his (or her) daughter in a similar plight to be accorded the same relief. No witnesses were called by the Attorney General to uphold the view that the child might quite well and safely have been allowed to go to term.—I am etc,

Lincoln August 2 M D M.R.C.S

Diabetes and Pulmonary Tuberculosis

SIR,—If I may be allowed to add a note to Dr S Roodhouse Gloyne's article in the *Journal* of July 30 (p 218) I should be grateful because in this country there has been very little apparent interest in this problem.

At the end of 1934 of the 1 000 diabetics who had attended the clinic at King's College Hospital forty two had pulmonary tuberculosis, two of these had developed diabetes while under treatment for the tuberculosis making an incidence of 4 per cent in those with diabetes. The mean incidence of figures published at this time among diabetics was in the U.S.A. 2 6 per cent in the Argentine 5 2 per cent in Austria 7 6 per cent.

The present rise in the number of deaths from diabetes and the decline from tuberculosis, mentioned by Dr Gloyne can be contrasted with war time experience when there was a decrease in the mortality from diabetes and an increase in the mortality from tuberculosis (Registrar-General's *Statistical Review for 1934* p 101). Is it fantastic to compare the malnutrition enforced by a blockade with that produced by an insufficient supply of insulin? Though what alteration from the normal is responsible for the encouragement of the seed is still a matter for discussion. It is to be hoped that the higher carbohydrate diets and other methods of treatment of both diseases will reduce the mortality.

The tendency of the diabetic to develop tuberculosis should not be forgotten and, as the onset appears to pro-

duce fewer symptoms than usual it might be worth while making a periodic radiological examination in all diabetics to find it as soon as possible in the 4 per cent or so who are likely to develop it—I am, etc

Southampton August 1 G D PIRRIE

Undescended Testicle

SIR—I was not only impressed with the clarity and logical reasoning of Mr Denis Browne's article on this subject in the *Journal* of July 23 (p 168) but I was also grateful to him for introducing me to the "superficial inguinal pouch" Having read this article I determined to review all the cases I had treated with 'pregnyl' in the light of his classification

I have felt for some time that there would be less misunderstanding between the surgeon and the endocrinologist if the anatomical position of the testicle in the cases treated could be more accurately defined My experience of the surgical treatment of this condition is limited to the period when I served as assistant house-surgeon and later as house surgeon at this hospital eight years ago My impression is that, at that date, such treatment yielded satisfactory results in by no means 100 per cent of cases My knowledge of the effect of leaving these cases untreated is confined to conversations with the medical officers attached to certain public schools This has led me to accept the view that endocrine treatment, in a certain number of cases is redundant I feel that many would agree with me that a symposium on the management of undescended testicle written by an anatomist or surgical anatomist a school medical officer a surgeon and an endocrinologist would be a valuable contribution to the subject

During the past five years I have been interested in the condition exclusively from the point of view of its treatment with luteinizing gonadotropic extracts and my experience has led me to believe that about 70 per cent of suitably selected cases[1] result in the testicle appearing and remaining in the scrotum, and that in 50 per cent of the successful cases this occurs within three months of the commencement of such treatment On two occasions, in both of which endocrine therapy has failed to induce descent of the testicle I have noted effects to which some would have taken exception—namely, enlargement of the penis in one case and priapism in another Perhaps I was immodest in failing to be alarmed by the first complication Fortunately the second was so transient as to trouble my conscience for only a month

So seriously did I receive Mr Browne's article that I was disappointed to learn from his reply to your annotator that he had entrenched himself in a "carefully prepared position" and that his paper was therefore presumably designed to be provocative I was prepared to accept his deprecation of treatment with gonadotropic extracts as a sign of the earnestness of his convictions but now I am glad that he has admitted that it was 'sweeping' and "in opposition to the findings of other workers,' and I feel justified, therefore in reminding him of those cases of general impairment of pituitary function usually classified under the title of Frohlich's syndrome in which treatment with gonadotropic preparations is particularly effective in inducing descent of the testicle

Finally I was sorry to see him raise the unanswerable argument of the possible adverse effects of endocrine treatment in the remote future It was surprising to find a man with his capacity for clear thought resort to such a red herring All the considerable knowledge which we possess of the effect of endocrine preparations leads us to suppose that it is purely transient, otherwise why would we administer them in twice- or thrice-weekly doses? We have no reason to suppose that gonadotropic extracts are any exception to this impression If Mr Browne views with suspicion the effect of such endocrine extracts until they have been in use for sixty years he must wait another forty-four years before his conscience should allow him to employ insulin and thirteen years before he is convinced of the importance of Murray's treatment of a case of myxoedema with thyroid extract in 1891—I am etc

P M F BISHOP

Endocrine Clinic Guy's Hospital S E 1
August 6

*** In his letter published last week at page 318 Mr Denis Browne ascribes two arguments to the author of the annotation which appeared with his article in the *Journal* of July 23 He writes "The first is that a testicle in the inguinal canal can be felt because the tendon of the external oblique is not always tense Reference to the annotation will it is hoped convince Mr Browne that what was disagreed with was his statement that "a testis that is in the inguinal canal cannot be felt through the skin Mr John Hosford's letter (also published last week at p 318) gave further evidence of the validity of our criticism of Mr Denis Browne's statement The second argument which Mr Browne ascribes to the author of the annotation is 'that it is impossible to tell on examination whether a suprapubic testis is in the canal or in the subcutaneous tissues The actual words printed were "It seems more reasonable to classify non scrotal testicles as (1) those that can be felt—which may be, but are probably not in the inguinal canal—and (2) those that cannot be felt which may be anywhere —ED *B M J*

SIR—Mr John Hosford's query (*Journal* August 6 p 318) about the testicle which can be felt before operation above the pubis and which at operation is found in the inguinal canal is answered both in my original paper and in my subsequent letter It belongs, of course to one or other of the 'emergent' types

It is interesting to me, however as showing the way in which misconceptions have arisen in the past and will continue in the future I may be wrong in the conclusions I have come to but the first step to proving me wrong is to understand what those conclusions are I do not think anyone can do this who has not first identified by examination all the types I describe and subsequently made careful bloodless dissections of them at operation The opportunity for doing this in the normal categories occurs in herniotomies in children, when the superficial inguinal pouch can be studied It makes a very pretty demonstration, suitable for post graduate classes to expose the fascia of Scarpa push up the testicle under it, open the pouch and define its boundaries But, as in many other demonstrations which I am accustomed to make, it should be accompanied by a warning to be very careful how knowledge of this kind is used in examinations Mr Hosford is surprised that his classes do not recognize the superficial inguinal position as an ectopia How many of their examiners do?

I apologize for referring to the testis as the testicle not to mention calling the testicle the testis It is what Mr H W Fowler in his *Modern English Usage* calls in Elegant Variation—a common fault of unskilful writers —I am etc,

London, W 1, August 8 DENIS BROWNE

[1] My definition of 'suitably selected cases' is expressed elsewhere (*Lancet* 1937 1 598)

Sulphanilamide for Meningococcal Meningitis

SIR,—The letter of Major J. J. O'Meara in the *Journal* of August 6 (p. 317) indicates some doubt as to the efficacy of sulphanilamide in the fulminating sporadic type of meningococcal meningitis. In one of the two cases which he quotes treatment with serum and soluseptasine (May and Baker) was given. Now Whitby (*Lancet* 1937, 1, 1517) showed that the benzylsulphonamide preparations proseptasine and soluseptasine were *inactive* in experimental *meningococcal* infections. In a recent article (*Lancet* 1938, 2, 8) I pointed out this fact and also gave some indications for dosage of sulphanilamide in this disease. The series described contained a considerable number of sporadic fulminating cases with haemorrhagic rashes.—I am, etc.

H. STANLEY BANKS,
Medical Superintendent,
Park Hospital.

Hither Green, S.E.13, August 6.

Chemotherapy of Gonorrhoea

SIR,—Your annotation of August 6 (p. 294) rather emphasizes the toxic effects of uleron in cases of gonorrhoea.

During the last seven months I have given uleron to 200 cases of gonorrhoea in the male—all ambulatory cases under observation by me at three- to four-day intervals. The dosage has been 3 grammes in twenty-four hours (1 gramme every eight hours approximately) for five consecutive days, omission of uleron for two to four days, and repeating the five days' Stoss with same dosage. Patients were told not to eat eggs or take Epsom salts; no other instructions. The great majority have received three such Stoss. One patient only has shown any suspicion of toxic effect, and that was a case of photosensitive dermatitis like solar erythema, though not exposed to sunlight. A further twelve cases have received 4 grammes in the first twenty-four hours of the five days' Stoss. None has shown any toxic effect.

In my hands uleron has proved more effective and safer in gonorrhoea in the male than had sulphanilamide (prontosil album)—ninety-nine cases. Uleron is effective in early gonococcal infections five to fourteen days old, but even more effective in infections of twenty-one days and over.

In staphylococcal infections—boils and three cases of carbuncle—uleron in the above dosage for five consecutive days has been effective and without toxic effects.—I am, etc.

H. M. HANSCHELL,
Honorary Medical Superintendent and Medical Officer i/c Venereal Diseases Department, Royal Albert Dock Hospital.

London, E.16, August 6.

X-Ray Screening in General Practice

SIR,—With regard to the interesting and helpful commentary by Dr. J. V. Sparks in your correspondence columns of July 30 (p. 256) dealing with the use of fluoroscopy in examinations of the chest, I believe that early lesions in the lungs would be more frequently detected by screening if greater attention were paid to certain important factors.

A screen of first-class quality is obviously required. A small focus tube is helpful in the elucidation of detail. X-ray penetration may have to be increased in the obese, the very muscular, and in deep-chested subjects. The patient may have to be examined in different positions, special care being taken to eliminate the shadow of the scapulae. After a general view of the chest with wide-open diaphragms, then comparing the same zones on either side with a slightly smaller opening, it is generally advisable to examine any suspected region with a small aperture.

Most important of all factors, however, is the necessity for taking adequate care to adapt fully the eyes to the darkness of the screening room. It is I believe failure in this regard which probably accounts for the majority of the cases in which Dr. Sparks states that early lesions of the lungs are not often visualized by screen examinations. With full adaptation of the eyes and optimal technical conditions I have seen clearly on the screen quite small nodular infiltrations limited in extent and small Assmann's foci which were not at all dense.

As I am employing radioscopy constantly, I take care when engaged in this work to secure sufficient adaptation of the eyes by wearing red goggles for at least twenty minutes before beginning screening, and at any time when I am obliged to leave the x-ray room between cases. When my eyes properly adapted for screening I have rarely had any surprises from subsequent radiography.—I am, etc.

Montana, Switzerland, August 4. HILARY ROCHE.

Complications of Gold Therapy

SIR,—Having used chrysotherapy for the treatment of rheumatoid arthritis since 1932, I entirely disagree with Dr. H. Warren Crowe's statement in his letter in the *Journal* of July 30 (p. 261) that vaccines yield as good results as gold therapy. I have long since given up the treatment of rheumatoid arthritis with vaccines because of the extremely disappointing results, whereas with chryso therapy practically all cases have shown beneficial results, some almost miraculous. Patients crippled and bedridden who could only get about in bath chairs or on crutches have been able to walk unaided and in many cases even resume their household duties and other occupations. Some of these patients were at first treated by vaccine therapy according to Dr. Crowe's method with negative results and then they were subjected to chrysotherapy with remarkable improvement.

With regard to reactions in my experience those cases that produced reactions did better than those that did not, so that one should adjust the dosage to produce some reaction. Severe reactions can usually be avoided by simultaneous injection of calcium gluconate. In over 100 cases of rheumatoid arthritis treated by chrysotherapy I have never had any gold abscess and therefore no "gold abscesses which fail to heal for months" as Dr. Crowe states. With regard to his statement that "one often has the greatest difficulty in persuading an entirely suitable patient to agree to chrysotherapy," most of my time is spent in dissuading patients who come to me requesting gold treatment for their arthritis but whom I consider are not cases of true rheumatoid arthritis and therefore not suitable for chrysotherapy.

Finally, at the recent discussion on rheumatoid arthritis at Plymouth I noticed that all the principal speakers were unanimously of opinion that chrysotherapy was the only effective treatment for this condition and most of them had given up vaccine therapy because of its disappointing results.—I am, etc.

London, W.1, July 30. MAURICE NEWMAN.

Tuberculin in Diagnosis

SIR—Dr J R Forbes (*May 21 p 1311*) states "I have been unable to find any convincing grounds for believing that a positive test is of any value in indicating the presence or absence of active tuberculous disease May I quote Professor Sahli "As much as I consider the early diagnosis of tuberculosis of importance, as much as I am a firm believer in the therapeutic value of tuberculin, yet I am anxious to state emphatically that I condemn absolutely the diagnostic injections of tuberculin The experience of many workers, as reviewed by Wolff-Eisner, proves that the result of the so called diagnostic injections, be it positive or negative, proves nothing

Professor Sahli, in a footnote, also states "That great value is given to diagnostic tuberculin injections in veterinary work is due to the fact that in veterinary work it is sufficient to prove that an infection had taken place, whereas in human medicine it is a question of the nature and of the activity of the disease —I am, etc,

Sydney, July 12 A E FINCKH

Blood Groups and Legislation

SIR—Public opinion on the question of the usefulness of blood grouping in paternity cases has been aroused It is reported that Lord Merthyr intends to introduce legislation to make such tests compulsory in paternity cases to include twelve groups instead of the international standard groups of O, A, B, and AB and to recognize only pathologists working in certain laboratories In my opinion the British Medical Association should make some definite statement on this question in the interests of science, the profession and all those concerned There are many points on which only those who have been working at the subject for some years—serologists, biochemists, and physiologists—can give definite information, but there are some questions which require decision of more general interest alike to the public and our profession

1 *Legislation*—Has the time come for legislation and if so what form should this take?

2 *Grouping*—What system of grouping is to be recognized? Can we safely go beyond the four groups and if so what other groups are to be included? The four groups themselves give six subgroups Matta would have seven main groups Several parents of A_1 group were found who had given birth to O children (heterozygotes) so to what extent could any medical man say AB tests are 'infallible'? Landsteiner and others have found agglutinin A_2 acting on O cells Bauer's theory of inheritance was introduced to explain the existence of O children in some cases of AB parents As to the M and N agglutinogens they are independent of A and B but since they can be present or absent in each group how far can they be recognized as of sufficient value for medico-legal purposes? Can they not be normal constituents of the red cells and be present or absent according to the state of health or disease in an individual at the particular time of the investigation?

3 *Statistics*—These are not generally agreed upon and while the mother may have a 5 to 2 chance in her favour with certain statistics of the four groups to what extent will this be altered alone or in combination with the M and N grouping if these are allowed?

4 *Sera*—I think it would be generally agreed that only certain laboratories or research institutes or workers should be recognized to supply these

5 *Who should Give Evidence?*—It has been suggested that a panel of pathologists only should be recognized Surely it is a new departure in legislation to penalize science and the profession generally by such discrimination? If reliable sera are available there can be no reason why others should not perform the tests in the interests of everybody The courts can be left to judge of the quality of the evidence produced Pathologists are by no means the best available persons for the job

6 *Reports*—With the range of groups and subgroups it will be advisable to determine what should go into these Are the temperatures at which the test was carried out to be included or not?

From this it will be seen that there is need for the British Medical Association to set up some committee of investigation to settle these questions in the interests of the profession and the public—I am etc

Ilford, July 23 A G NEWELL M D

Steinach II Operation for Prostatic Enlargement

SIR—In view of Mr Kenneth Walker's unfavourable opinion of Steinach II operation for prostatic enlargement (*Journal July 9 p 53*) two successful cases deserve record

1 The patient is 72 years old For some years he was getting up five to six or eight times each night Several times he had complete obstruction and had to be relieved by catheter The condition culminated in complete obstruction which persisted An indwelling catheter was fixed for some days without improvement Steinach II was done in May 1937 For one day after operation the catheter had to be passed Since then he has passed urine naturally and he can now sleep from 9 p m to 8 a m The improvement has been well maintained Micturition is normal Residual urine now is 1¾ oz General health is better than it has been for years

2 The patient is 79 years old For some years he had nocturnal frequency and once or twice had had temporary complete obstruction Latterly the frequency had been so great that he was being worn out by lack of sleep *Complete* obstruction with overflow incontinence came on in October 1937 Steinach II was done under local anaesthesia October 1937 At first there was no improvement An indwelling catheter was used for some days Three weeks after operation he was discharged from hospital having been taught to use a catheter He began to pass urine naturally six weeks after operation Four months after operation all urinary trouble had passed off and he could micturate freely This improvement has been fully maintained up to date He sleeps from 10 p m to 5 or 5.30 a m His general health has much improved

—I am, etc T HUNTER C I E, M D,
Ludlow July 28 Lieutenant Colonel I M S (retd)

"Psychosomatic Illness"

SIR—Whether the rising incidence of psychosomatic disease is real or only apparent seems to be a debatable question, but there is one factor on which stress might be laid as a predisposing cause of anxiety and an intensifying factor in many illnesses I refer to the manner in which the patient's disease is presented to his consciousness by the physician in attendance Too often the latter is content simply to label the patient with a medical term which means nothing to him—so far as any useful information as to the nature of his complaint is concerned—but which may be the cause of a great deal of unnecessary worry and concern

Patients as a general rule even the most stable minded, are morbidly apprehensive about their diseases and fear the worst Any vague ache or pain is magnified and dwelt on, and often the patient's mental conception of his disease might well be described as a "chamber of horrors In the case of an anxious and worrying type of patient a *superstructure of psychoneurotic symptoms* may be imposed on the basis of some quite simple but misunderstood condition How many women suffering

from simple mastitis have worried themselves into a condition of ill health because they fear they may have cancer and don't disclose this fact to their doctor? How many patients with some simple heart defect fear they may drop dead at any moment? And how many of these people have gone and read up their diseases in medical books always taking care to apply the worst interpretation to their own case?

A mild psychological investigation into the state of my patient's mind with the object of elucidating how he regards his particular illness would not be amiss in many cases at any rate if necessary the symptoms should be assessed at their proper value and a simple explanation of the trouble given to the patient in so far as possible non medical terms The ultimate factor in fighting disease is the patient himself and he can surely do this to better advantage if he knows exactly how he stands and is not left to grapple with his disease in the darkness of his own ignorance and fear—I am etc

Reading July 27 W HUTCHESON M D

The "Flying Squad" in Maternity Services

SIR—Professor E Farquhar Murray is to be congratulated on the excellent results obtained by his emergency unit as reported in the *Journal* of August 6 (p 313) but it must be admitted that the very existence of a flying squad *is in itself an admission of failure* Cases most urgently in need of the services of a flying squad Professor Farquhar Murray tells us, are those in which there was shock and post partum or ante partum haemorrhage also cases of threatened or actual eclampsia difficult labour or failed forceps That difficult labour should be allowed to take place in the patient's own home or that failed forceps cases should need the help of an emergency unit is a serious indictment of our maternity services

Sir Ewen Maclean is reported on page 304 of the same issue as having said that local authorities could have in large measure that reduction in maternal mortality which they were willing to pay for and it is evident that if local authorities were willing to provide hospital accommodation for all maternity cases where the slightest abnormality existed or might arise the flying squad would seldom if ever be called to assist the practitioner attending a patient in her own home With all abnormal cases in hospital there would only remain the possible emergency of haemorrhage to which the flying squad might be called, and haemorrhage associated with the absolutely normal confinement must be rare indeed—I am etc

New Barnet August 6 JOHN ELAM

E F Harrison

SIR—I was very glad to see in the *Journal* of August 6 (p 295) the tribute to E F Harrison in view of his long and honourable connexion with the *Journal* Perhaps the following reminiscences may be of interest to some of your readers

I first met Harrison when I was in practice and he was a traveller for a drug firm—in which position he was obviously a *misfit* I next heard of him on the laboratory staff of Burroughs and Wellcome and was delighted when I came on the B M A staff to find that he was doing the analyses for the *Journal's* Secret Remedies series Before the Select Committee of the House of Commons on that subject he was our chief witness and made a profound impression by his high standard of accuracy and his obvious desire to claim no more for his analyses than was justified Shortly after the war broke out he came into my office in a very ill fitting khaki uniform He had joined one of those ill defined corps which were intended for men past their first youth and he told me his duties were mainly of a domestic nature such as cleaning out barracks *He* was the last man to complain but when I next saw Sir Alfred Keogh at the War Office I told him it was a pity the Army couldn't make better use of really fine expert workers I hope my mention of Harrison had something to do with his next move for when I next saw him he was busy with anti gas work and was happy It was a real grief to his friends when he fell a victim in the influenza epidemic of 1918 for there is little doubt that still greater honours awaited the man who so rapidly rose from a humble private to be lieutenant-colonel with a C M G

It is pleasing to recall that Harrison said more than once that the confidence reposed in him by Sir Dawson Williams had been of the greatest assistance to him in establishing him as undoubtedly the greatest authority on certain forms of chemical analysis The Pharmaceutical Society honoured his memory by establishing an annual Harrison Lecture Nobody who met H even casually could fail to be impressed by his strong personality his tenacity of purpose and above all by his transparent honesty and sincerity—I am etc

London W C 1 August 6 ALFRED C

Obituary

SALVATORE CASSAR M D

The Malta Branch of the British Medical Association has suffered a serious loss by the death on July 20 of Professor Salvatore Cassar M D, emeritus professor of surgery in the Royal University of Malta and consulting surgeon to the Central Civil Hospital, and one of the oldest members of the Branch

He was born on October 5 1861 he qualified in 1886 and after serving as resident in the Central Hospital was appointed junior surgeon In 1900 he succeeded to the chair of surgery and was made senior surgeon to the hospital appointments which he held up to October 1926 when he retired on reaching the age limit Professor Cassar's career as a surgeon coincided with the revolution in surgery brought about by the introduction of Listerian methods and it is due to him that antisepsis and asepsis were firmly established in Malta even before they were accepted in other and perhaps more important centres He took a leading part in the conduct of affairs of the university and was always an ardent advocate of all that meant progress and development Upon the grant of self government he took a leading part in organizing the profession and also entered the political field He joined the Constitutional Party and was elected a member of the Senate of which he became the vice president

Professor Cassar joined the British Medical Association in 1889 and throughout his career maintained a very active interest in the Malta Branch and kept up his interest to the very last He served almost continuously as a member of the Branch Council and occupied the presidential chair on many occasions

Dr HERBERT MIDGLEY COCKCROFT who died on July 9 aged 63 was a well known and popular figure in the district of Yorkshire known as Mashamshire. A student

of Owens College, Manchester he obtained the Scottish triple qualification in 1899 He then returned to his native town of Masham to continue his father's practice there and in 1901 was appointed medical officer to the district council and medical officer of health During the greater part of the war he served with a temporary commission as captain R A M C, and was awarded the Military Cross On returning to civil life he became commandant of the Masham Branch of the British Legion and was for many years chairman of the local sports committee Dr Cockcroft was elected a member of the Harrogate Division of the British Medical Association in 1901

Dr REGINALD JOHN HEARN who died on July 13, had been a member of the Marylebone Division of the British Medical Association for the past eighteen years At Cambridge he took his B A in the Natural Sciences Tripos of 1911 and then entered Guy's Hospital Qualifying as L M S S A in 1914, he graduated M A M B, B Ch Camb in 1918 and proceeded M D in 1921, having by that time been called to the Bar by the Middle Temple He had served throughout the war as captain R A M C and afterwards with a commission in the R A F Medical Service At Guy's he held a number of junior posts resident and non-resident and for some time worked in dermatology and venereal diseases He was also interested in diseases of the nervous system, and acted as neurology specialist under the Ministry of Pensions Dr Hearn was for some years physician in charge of out-patients at the Westminster Skin Hospital and assistant deputy to Mr Ingleby Oddie, coroner for Central London In 1922 he published in these columns a paper giving the results of treatment in syphilis of the nervous system

Universities and Colleges

UNIVERSITY OF OXFORD

In Convocation on July 30, presided over by the Vice-Chancellor, the honorary degree of D Sc was conferred on Dr Charles Gustave Jung Professor of Psychology in the University of Zurich on the occasion of his presidency of the tenth International Medical Congress for Psychotherapy

The following medical degrees were conferred in congregation on the same day

M D—H F Moseley

B M—W D Brinton S H Llewellyn Smith, J B Longmore R R Wethered, A M L Isabella (Society of Oxford Home Students)

UNIVERSITY OF CAMBRIDGE

The Appointments Committee of the Faculty of Medicine has appointed F R Berridge, M B, B Chir of Trinity College, Assistant in Research in Radiology (diagnostic) to the Regius Professor of Physic, and A Paterson M B Ch B D Psych, of the University of Edinburgh Assistant in Research in Psychiatry to the Regius Professor of Physic both for three years from October 1, 1938

At the last Congregation of the academical year held on July 30 the Vice Chancellor Professor H R Dean, conferred the following medical degrees

M D—M Hynes M L Rosenheim *By proxy* T F McN Scott

M B B Chir—A J Daly A C F Green, W W Wiggins Davies B J O Winfield M D Young J W Wood, R W W Brown D M Carding J E *Hardwick Smith* P L *Mollison*, R D Caton, M J Clow, W Goulstone P A K Jones G B Leyton A G McPherson J A R Miles W A M Miller, D E Yarrow S G Hamilton L R Holt J Laughlin J S Pritt E Cronin R S Alexander R M Johnstone, J Smith J Yudkin R R Wilson A P Norman W E Owens N Vere-Hodge H F Whalley G M Wright D Foskett E L N Rhodes *By proxy* G N Hunt, P J Wormald, R O Murray B H Price, H Stott P L Candler J H B Round J S Pritchard, A J Wilton C H Bartlett R B Leech J G B Platts

UNIVERSITY OF LONDON

The Senate on July 20 awarded the degree of Ph D in Pathology (non clinical) to H Burrows and the degrees of Ph D in Hygiene (non clinical) to Wei Yung Lee and C G Warner

The following candidates have been approved at the examination indicated

M D—*Branch I (Medicine)* Helen Baker R H P Clark J R Forbes R V Harris N M Jacoby H Nicholson W A Oliver J B Robinson W J Stokes S J L Taylor P C Wickremesinghe *Branch II (Pathology)* I A Cathie C V Harrison S F Marshall E M Ward *Branch III (Psychological Medicine)* K Soddy Maeve Whelan *Branch IV (Midwifery and Diseases of Women)* H G E Arthure (University Medal) A Barber, E D Y Grisby *Branch V (Hygiene)* F W Gilbert

UNIVERSITY OF MANCHESTER

Mr F H Bentley M B F R C S, has been appointed Assistant Director of the Surgical Research Laboratory

UNIVERSITY OF ABERDEEN

The King has approved the appointment of Dr Robert Douglas Lockhart Professor of Anatomy in the University of Birmingham, to be Regius Professor of Anatomy in the University of Aberdeen in place of Professor A Low, resigned

ROYAL COLLEGE OF PHYSICIANS OF LONDON

At a meeting of the Royal College of Physicians of London held on July 28 with the President Dr Robert Hutchison in the chair, the following were elected officers for the ensuing year *Censors* C E Lakin G E Beaumont W E Hume A Feiling *Treasurer* Sir Charles McM Wilson *Registrar* H Letheby Tidy *Harveian Librarian* Arnold Chaplin, *Assistant Registrar* R Hilton

The President and Fellows decided that a memorial to the late Registrar Sir Raymond Crawfurd should be placed in the College

Unanimous votes of thanks were passed to Dr Sidney Phillips for his services to the College as Treasurer and to Dr Charles Newman for his services as Assistant Registrar

The following appointments were announced Mr Cyril Radcliffe K C as Senior Standing Counsel to the College, Dr R A Young as Harveian Orator and Dr J C Spence as Bradshaw Lecturer for 1939 Dr A W Stott as a member of the Joint Consultative Committee Dr A E Clark Kennedy as a representative on the Committee of Management of the Conjoint Board

The Bisset Hawkins Medal was awarded to Professor Major Greenwood F R S for his researches in statistics

The Murchison Scholarship was awarded to David Kendall M B

It was announced that a replica of the President's caduceus would be presented to the Royal Australasian College of Physicians and Dr Morley Fletcher was appointed to represent the College at the inaugural meeting of the Royal Australasian College

The following candidates having satisfied the Censors Board, were admitted Members of the College

A Ali, M B Bomb, I S Buchman, M B Lond, R H P Clark M B Lond N F Coghill M B Camb, H A Dewar, M B Durh Muriel J L Frazer, M D Belf, G G Gillam M B Lond E W Hart, M B Camb S A Henry, M D Camb F D M Livingstone M B Camb, the Hon W S Maclay M D Camb W P Mallinson B M Oxf, P E C Manson Bahr M B Camb, V R Naidu M B Mysore, H Nicholson, M D Lond, W A Oliver, M B Lond W W Payne M D Lond, J W Pierce M B Lond, W M Porteous M B New Zeal J M Ranking M B Camb, D E Rodger, M D McGill, J C Sinclair M D Toronto, T C Sutherland M B New Zeal W S Sutton, M B Liverp O H J M Telling B M Oxf, J W Todd M B Lond, P H Willcox, M B Camb

Licences and Diplomas

Licences to practise were granted to 185 candidates (including thirty-four women), whose names are published in the report of the meeting of the Royal College of Surgeons of England in this issue, as are the names of the recipients of the Diplomas in Tropical Medicine and Hygiene (twenty), Ophthalmic Medicine and Surgery (twenty five), and Medical Radiology (three) Diplomas in Anæsthetics were granted to the successful candidates whose names were published in the reports of the meetings of the Royal College of Surgeons of England in the *Journal* of June 25 (p 1395) (twenty-four) and in the *Journal* of July 30 (p 265) (seven) Diplomas in Public Health (twelve) Psychological Medicine (seventeen), and Laryngology and Otology (seven) were granted

to the successful candidates whose names were published in the report of the meeting of the Royal College of Surgeons of England in the *Journal* of July 30 (p 265)

ROYAL COLLEGE OF SURGEONS OF ENGLAND

An ordinary meeting of the Council of the Royal College of Surgeons of England was held on July 28 with the President, Mr Hugh Lett, in the chair

The cordial congratulations of the Council were given to Sir Holburt Waring and Sir James Walton on receiving the Order of Officer of the Legion of Honour

The Council accepted with grateful thanks the very valuable gift by Sir William Willcox of a chair which was formerly the property of John Hunter

Mr W Sampson Handley was reappointed to the Executive Committee of the Imperial Cancer Research Fund

Diplomas

Diplomas of Membership were granted to the following candidates who have passed the final examination in pathology medicine surgery and midwifery of the Conjoint Examining Board in England

Medical Notes in Parliament

On July 29 a Royal Commission signified the Royal Assent to all Bills awaiting it including the Finance Act Young Persons Employment Act Nursing Homes Registration (Scotland) Act Food and Drugs Act and the Divorce (Scotland) Act Statutes which have passed earlier in the session include among Government legislation the Air Raid Precautions Act Blind Persons Act Holidays with Pay Act three Housing Acts Mental Deficiency Act Milk (Extension and Amendment) Act, National Health Insurance (Amendment) Act National Health Insurance (Juvenile Contributors and Young Persons) Act Population (Statistics) Act and the Superannuation (Various Services) Act The Limitation Bill and the Marriage (Scotland) Bill await further examination and will presumably be dropped for this session

Private Members Bills which have reached the Statute Book include the Baking Industry (Hours of Work) Act

Children and Young Persons Act, Dogs (Amendment) Act, Infanticide Act, Nursing Homes Registration (Scotland) Act, Prevention and Treatment of Blindness (Scotland) Act, Registration of Stillbirths (Scotland) Act, Street Playgrounds Act, and Workmen's Compensation (Amendment) Act Private Members' Bills which have not passed are the Contraceptives Regulation Bill, the Local Authorities (Hours of Employment in connexion with Hospitals and Institutions) Bill, and the Prohibition of Vivisection on Dogs (Scotland) Bill The first two have been dropped

Before the Nursing Homes Registration (Scotland) Act received the Royal Assent the House of Commons accepted, as an agreed compromise, the House of Lords amendment authorizing the Department of Health for Scotland to exempt Christian Science homes from the Act

Both Houses have adjourned till November 1, unless summoned earlier for urgent business The King's Speech will be read on November 8

Milk (Extension and Amendment) Bill

In the House of Lords on July 19 the EARL OF FEVERSHAM moved the second reading of the Milk (Extension and Amendment) Bill

Lord MARLEY asked whether pasteurized milk was provided for children in the schools and if not what steps were taken to ensure that the milk provided was clean and not likely to cause any illness He said it was a tragedy that there should be any delay in the provision of milk for expectant and nursing mothers

The EARL OF FEVERSHAM said that according to the returns made to the Board of Education at the end of last March 2 672 000 children in elementary schools in England and Wales were taking milk under the milk-in-schools scheme That was 161 000 more than on the corresponding date last year Both the source and quality of the milk supplied had to be approved by the medical officer of health in the area Where possible in the larger urban areas and the great cities the medical officer of health insisted on pasteurized milk where it was available In those areas served by rural districts pasteurization was not always possible and the milk of attested herds was used Under the Bill an increased sum for milk was being devoted to schemes organized by local authorities not only for children attending elementary schools but for nursing and expectant mothers It was a feature of the Bill that in order to accelerate this service an extra £250 000 was being provided until the Government's long term proposals could be placed before Parliament

The Bill was read a second time

Mental Patients in Divorce Proceedings

On July 19 Mr SORENSEN asked the Minister of Health whether his attention had been drawn to the recent statement of the chairman of the Board of Control at the annual meeting of the Mental Hospitals Association respecting mental patients affected by divorce proceedings and obligations on the part of a medical superintendent definitely to express his opinion in reply to questions by petitioners or petitioners' solicitors whether a patient was or was not curable and whether he proposed to circularize mental hospital committees to this effect

Mr BERNAYS said he understood that the Mental Hospitals Association circulated to their members a communication on this subject from the Board of Control last January On the information before him the Minister of Health was doubtful whether it was necessary to issue a circular to mental hospital committees

Grants to Edinburgh and Glasgow Universities

On July 19 Mr G MORRISON asked the Secretary of State for Scotland whether he could make a statement on the report of the Special Committee under the chairmanship of Lord Alness on the application by the Scottish universities for grants from the Education (Scotland) Fund Mr COLVILLE replied that after careful consideration of the terms of the report he had decided that in accordance with certain of its recommendations grants of £4 000 and £12,000 should be paid from the Education (Scotland) Fund to the Universities of Edinburgh and Glasgow respectively before July 31 the end of their present financial year With regard to 1938–9 and future years he hoped that the state of the Fund would also make it possible for him to give effect to the recommendations of the report The payments in the current year to the Universities of Edinburgh and Glasgow must not be regarded as in any sense implying acceptance of the principle that the Scottish universities might rely on the Education (Scotland) Fund to meet any future deficiencies which they might incur The claims of each university on the Fund must be considered each year in the light of the financial and other circumstances that might arise and of the annual reports which it would under statute be the duty of each university receiving assistance to submit to him

Health of Mine Workers

In committee of the House of Commons on July 25 the vote for the Mines Department was considered Captain CROOKSHANK referred to the work of the Safety in Mines Research Board He said that the programme of pit head baths was going rapidly forward Apart from official work a great deal was being done by all sorts of technical bodies which were constantly making investigations and discussing them at their meetings Noise seemed to him to-day to be one of the urgent problems that had to be considered A great many miners felt that with the coming of the machine they did not hear the natural noises which in the past acted as warnings to them Much research could therefore be done into this problem He was not able to state when the report on the investigations into silicosis was likely to be produced The inquiry was being pressed on however

Medical Refugees and the Colonial Medical Service

On July 25 Sir ERNEST GRAHAM LITTLE asked the Secretary of State for the Colonies whether in view of the large number of able and qualified doctors at present refugees from Greater Germany he would consider the possibility of appointing some of them to subsidiary positions in the Colonial Medical Service

Mr MALCOLM MACDONALD said it was not quite clear what posts Sir Ernest Graham Little had in mind when he referred to subsidiary positions in the Colonial Medical Service Admission to the Unified Colonial Medical Service was necessarily confined, broadly speaking to persons of British nationality though a person born or ordinarily resident in a Colony, Protectorate or Mandated Territory was not excluded If the reference was to minor posts in the local health services it had been the settled policy for some time to train the inhabitants of the various Dependencies to undertake this type of work and eventually to take over the higher branches of medical and public health work as they became qualified to do so He did not think it was practicable to envisage any general scheme by which foreign medical practitioners could be incorporated in the State medical services of the Colonial Dependencies

Sir ERNEST GRAHAM LITTLE further asked the Secretary of State for the Colonies whether he was aware that whereas the number of persons to each qualified doctor in Great Britain was approximately 1 000 in some parts of the British Colonies the proportion was as high as 100 000 to one, and whether in these circumstances he had under consideration any plans for increasing the personnel of the Colonial Medical Service

Mr MALCOLM MACDONALD replied that the ultimate objective at which the Colonial Office was aiming in developing the medical services of the Colonial Dependencies was to bring the best modern medical resources within the reach of the whole of the peoples of the Dependencies It would be impossible in most cases to give accurate figures regarding the proportion of qualified medical practitioners to the population in each Dependency without reference to the Colonial

Governments Nor indeed would such figures give a reliable picture of the position since a single Dependency might contain areas at very different stages of development There was no doubt that in some areas we were very far from having attained the objective which he had defined On the other hand there were many places where ample medical facilities both public and private were available The public health services of the Dependencies were being continually developed as funds and circumstances permitted but having regard to the large areas and populations to be covered it was clear that the eventual attainment of the objective must depend not on an indefinite increase in the number of imported medical officers but on the progressive training of medical staffs drawn from the local inhabitants The policy of training such staffs was being actively pursued wherever possible

In the meantime the responsibility for the education of the local populations in the many aspects of preventive medicine for the organization of the public health services and for the treatment of disease rested principally on the members of the Colonial Medical Service and there could be no doubt that for many years to come that Service would continue to call for a steady flow of recruits of the best personal and professional type from this country The present state of recruitment for the Service was satisfactory and it could not be said that the demand substantially exceeded the supply of fully suitable candidates. There had been some recent difficulty in recruiting for service in the West African Dependencies but he had no reason to suppose that this difficulty was other than temporary

Working Hours of Nurses

On July 26 Mr BULL asked the Minister of Health whether his Department had considered the working of the ninety six hour fortnight for nursing staffs in general with special reference to the London County Council scheme if he was aware that aspects of this scheme so far as night duty was concerned were resented by the staff and if he would consider the possibility of evolving some agreed system of hours affecting all nurses which local authorities could introduce without essential modification

Dr ELLIOT said that his attention had been drawn to the decision of the London County Council to introduce a ninety six hour working fortnight for nurses in their employment but he was unable to make any general statement on this subject pending the issue of a report by the Interdepartmental Committee which was considering the conditions of service of nurses

Grants for Cancer Research

Mr W GREEN on July 26 asked the Chancellor of the Duchy of Lancaster as representing the Lord President of the Council the amount of public grant made during the last twelve months towards the cost of cancer research involving experiments on living animals and the amount granted in respect of such research not involving such experiments Earl WINTERTON said that the amount expended by the Medical Research Council from public funds during the last financial year on investigations into the nature and cause of malignant disease and methods for its treatment was approximately £6 000 in addition to which valuable quantities of radium were lent to hospitals for this purpose It was not practicable to give separately the cost of such parts of this work as involved experiments on animals

Health and Hygiene in British Ships

On July 26 Mr WINDSOR asked the President of the Board of Trade if during 1937 of 6 664 vessels subjected to sanitary inspection by the Hull and Goole port health authority 1 670 were found to have defects whether he would consider the advisability of strengthening existing powers for ensuring proper standards of maritime hygiene initiate measures to secure a more rigid compliance on the part of shipowners with the rulings of responsible medical authorities and take steps to secure the observation of essential standards of cleanliness in all British ships

Mr OLIVER STANLEY said that the port health authorities had full powers under the Public Health Acts to require the abatement or themselves abate on ships within their districts insanitary conditions or other nuisances injurious to health The duty of seeing that crews quarters were kept in a fit condition fell primarily on the master as representative of the owners The Shipping Federation and the National Union of Seamen had recently set up a joint committee to consider methods of improving the standard of comfort and cleanliness in crews accommodation As regards structural defects close co operation was maintained between officers of port health authorities and Board of Trade surveyors and in appropriate cases suitable measures were taken under the Merchant Shipping Acts

Tuberculosis in the Grinding Industry

During the discussion on Home Office administration in the House of Commons on July 27 when a motion was made for the second reading of the Appropriation Bill Mr MARSHALL said the whole scheme of the Metal Industries Silicosis Order was too narrow All allied diseases such as pulmonary tuberculosis were excluded If the present eliminatory process caused by introduction of new tools in the grinding industry went on very few workers would come under the scheme in a few years The silicosis scheme centred on the metal grinders of Sheffield where the medical officer of health Dr Rennie reported that cases among 4 600 grinders numbered 149 Among these grinders the death rate from respiratory tuberculosis was four times the rate for all persons over 15 in Sheffield although the new abrasive wheel which was to bring about a revolution in the industry had been in operation in many cutlery factories in Sheffield for twenty five years There were more cases of tuberculosis among Sheffield grinders than among the miners and stonemasons in the city Phthisis fibrosis and tuberculosis were all rampant among grinders and the decrease had been much less than the decrease among the general population Yet the silico is scheme excluded men who had worked for three years on the abrasive wheel File grinders were excluded because safe guards were provided in their case The Home Secretary should investigate the matter with a view to bringing in the men who suffered from these diseases and could prove that the disease arose out of their employment

Mr TOMLINSON spoke of workers in Lancashire who were affected by dust in the card rooms He said the medical explanation of what took place in the sufferer as the result of the inhalation of this dust had varied very little over a period of years The difficulty of dealing with the question was said by representatives of the Home Office to be due to the fact that it was not possible to draw a line between the individual who contracted the disease in the card room and the individual who might contract a similar disease outside Other persons contended that this line could be drawn and he hoped that as a result of his raising the question that afternoon some relief could be brought to the sufferers

Mr JOHN spoke of the difficulty of a miner securing certification for nystagmus He said the medical referee at present was judge jury and court of appeal in one A man might be certified by his own doctor and by the certifying surgeon to be suffering from nystagmus but if the medical referee certified that the man was not so suffering, that decision was final Even the British Medical Association said that was too much responsibility for one man and that there ought to be at least three men forming a Board

Earl WINTERTON replying to the debate said the officials of the Home Office and the Home Secretary were alive to the importance of silicosis The disablement cases certified by the Medical Board in the refractories industries were less than five in each of the last five years except one year when there were seven The figures for potteries had fallen in the same five years from 70 to 41 and for stonemasons outside the

sandstone industry from 72 to 56 The figures for metal grinding were 8 in 1937 Prevention in coal mining and sandstone quarrying was a matter for the Mines Department The extension of the Factories Act to cover builders yards and building operations would permit further regulations There were legislative difficulties in the way of bringing the Sheffield class of little masters under the Act It seemed hard that workmen still employed in grinding after June, 1927 might get compensation if they became affected, while workmen not employed after that date were outside the scheme, but it would be difficult to make the scheme retrospective

The question of men in the grinding industry who suffered from a mixture of silicosis and tuberculosis was intertwined with one matter which was under consideration and another which was *sub judice* A committee had been appointed by the Medical Research Council which was inquiring into the incidence of pulmonary diseases other than those which could be definitely diagnosed as silicosis The report of that committee would not be available until the middle of next year and the question was also mixed up with workmen's compensation The Home Office recently placed before representatives of employers and trade unions revised proposals for amending the silicosis scheme These included extension of examinations to workers in additional processes in the pottery industry particularly in the manufacture of earthenware The Home Office had no evidence to show that the silicosis compensation scheme should be extended to slate workers in North Wales but the Mines Department was inquiring into the working conditions and in the light of the results it would be considered whether a further medical inquiry should be undertaken It would be difficult before the middle of next year to get the results of the inquiry being made under the auspices of the Medical Research Council into diseases of a pneumonic character in mines There had been 5 000 cases investigated and it would be necessary to examine the workers at another colliery

The Stewart Committee had presented a report in January containing recommendations on miner's nystagmus He could not say whether the whole or part of that report would be implemented The question of card room operators was extremely difficult from a medical point of view in ascertaining whether the workmen suffered from bronchitis or asthma due to dust or due to natural causes The committee appointed last year to go into the matter had heard evidence had carried out statistical investigations, and was now considering its report

The debate was concluded and the Appropriation Bill was read a second time

Scottish Department of Health

Mr COLVILLE answering Sir Samuel Chapman on July 28 said the Departmental Committee on Scottish Administration, of which Sir John Gilmour was chairman, recommended four main Scottish Departments each in charge of a Secretary directly responsible to the Secretary of State Health would be one Department The Board of Control would be reconstituted with a full time instead of a part-time chairman, and its work as well as that of the Registrar General, brought more closely into relation with the Department of Health The day to day administration of these Departments would be conducted from Edinburgh The Government was in general agreement with these regulations and would introduce legislation early next session

Major Stuart Blackmore

Dr HADEN GUEST asked on July 28 whether Sir Samuel Hoare was aware of the circumstances leading to the death of Major Stuart Blackmore chief medical adviser Air Raid Precautions Department Home Office as a result of overwork and other adverse conditions and that Major Blackmore left a widow and two children and whether he would inquire into all the circumstances and into the propriety of recommending special provision for the dependants

Sir SAMUEL HOARE said in reply that Major Blackmore was a valued servant of the Air Raid Precautions Department of which he had been chief medical officer since early in 1936 and his recent death was a great loss to the Department It was not possible to make any grant to the widow from public funds No pension was payable to the widow of any civil servant whether established or unestablished and a gratuity was only payable in the case of an unestablished officer where at the time of his death he had not less than fifteen years service

Dr HADEN GUEST asserted that certificates showed that in the opinion of the doctors who attended Dr Blackmore the unusual circumstances of his work contributed materially to his death Dr Guest asked Sir Samuel to investigate why seven days before Major Blackmore's death a letter was sent to him informing him that his pay had been stopped—a knock-out blow to a man on his death bed

Sir SAMUEL HOARE said that in respect of the dependants he was bound by statute law He would look into the point about pay Major Blackmore was ill upon several occasions during his employment by the Air Raid Precautions Department and those who knew the circumstances of the case at the time would say that the Home Office treated the case with the greatest sympathy

Mental Hospital Accommodation in Lancashire

Answering Mr Porritt on July 29, Dr ELLIOT said the number of patients in the Lancashire mental hospitals on January 1 last was 14 339 Proposals had been approved to increase the accommodation at four of the mental hospitals by 965 beds and other proposals were under consideration for adding a further 300 beds Plans were also being prepared for a new mental hospital of 1 000 beds The patients in the mental hospitals in Lancashire in each of the last five years on December 31 were

	Males	Females	Total
1933	6 174	7 532	13 706
1934	6 310	7 618	13 928
1935	6 294	7 589	13 883
1936	6 368	7 707	14 075
1937	6 444	7 895	14 339

The patients who recovered sufficiently during those years to be discharged were

	Males	Females	Total
1933	395	519	914
1934	384	558	942
1934	379	526	905
1936	353	507	860
1937	311	462	773
Total	1 822	2 572	4 394

Dr Elliot further informed Mr Porritt that the weekly hours of duty expected from the nurses in the mental hospitals in Lancashire were fifty-two exclusive of time off duty for meals The proportion of nurses to patients was approximately one nurse to eleven patients by day and one nurse to fifty-six patients by night

Mr PORRITT asserted that there was a great shortage of nurses in these institutions and that the proportion to patients should be one in six Dr ELLIOTT agreed that there was a shortage in many institutions

Jamaican Medical Service Appointment

Mr CREECH JONES asked on July 28 whether the attention of the Secretary of State for the Colonies had been drawn to an advertisement for a doctor born in the United Kingdom and of European parentage to serve in Government medical service in Jamaica whether it was the policy of His Majesty's Government that discrimination should be established in this and other appointments in the West Indian colonial services, and on what grounds this discrimination was advertised

Mr MALCOLM MACDONALD in his reply assumed Mr Jones referred to the advertisement for a health officer in the Government Medical Service in Jamaica which appeared in the *British Medical Journal* and the *Lancet* of May 28 1938 That advertisement stated that candidates must be British subjects of European parentage because the Governor in reporting the vacancy stated that there was no suitable qualified officer available in the Colony It was assumed therefore that no useful purpose would be served by inviting applications from Jamaicans Far from there being any discrimination against the appointment of West Indians in the local government services in the West Indies it was the settled policy to utilize the services of local persons for appointments for which they were suitable and qualified

Incidence of Tuberculosis in the Gold Coast—On July 20 Mr MALCOLM MACDONALD said that in the report of the Gold Coast Medical Department for 1936 the senior medical officer in the Western Provinces described the incidence of pulmonary tuberculosis in the mining area as abnormally high A new hospital equipped with high power x ray apparatus had been built at Tarkwa Two officers of the Medical Department working in close collaboration with the mines medical officers had been posted to Tarkwa to conduct an investigation into the incidence of tuberculosis and silicosis

Diphtheria Incidence and Mortality after Inoculation—On July 25 Mr WEDDERBURN informed Mr McGOVERN that in Edinburgh out of approximately 27 000 children inoculated against diphtheria since 1924 140 had suffered from diphtheria and three had died In Aberdeen out of approximately 4,500 children so inoculated since September 1936 twenty three had suffered from diphtheria and none had died Information relating to Dundee and Glasgow was not available

Availability of Atebrin and Plasmoquine—Mr D ADAMS on July 26 asked the Secretary of State for War what proportion of the new drugs now being employed in combating malaria in the British tropical Empire especially atebrin and plasmoquine came from countries outside the British Empire and whether stores of these drugs were maintained with a view to ensuring that in the event of war tropical territories and the British Army would be safeguarded from disease epidemics Mr HORE BELISHA said that there was no technical difficulty in making these drugs which came from outside the British Empire Stocks were held and quantities were reviewed from time to time The question whether stocks were maintained for use by the civil populations of tropical territories was one for the governments of those territories

Health Services in Trinidad—On July 26 Mr MALCOLM MACDONALD replying to Mr Creech Jones said that progress had been made towards implementing the recommendations of the Trinidad Commission He circulated an account of the progress made in which it was stated that under the heading Medical and Health Services a draft Ordinance had been prepared to transfer the executive functions of the Central Board of Health to the Director of Medical Services As regarded housing the Governor contemplated the establishment of a town planning and housing authority which would carry out a far reaching plan of slum clearance Legislation was being drafted for this purpose

Mentally Defective Children in Lancashire—The number of children ascertained to be mentally defective within the meaning of the Education Act, 1921 on December 31 1929 was 4 848 or 0 67 per cent of the average number on the registers of the public elementary schools in Lancashire and on December 31 1937 (the latest date for which figures are available) 3 702 or 0 56 per cent of the average number on the registers These figures do not include children of school age notified to the mental deficiency authority as uneducable or on other grounds

Bandages in Prison Surgery—Mr COLVILLE told Mr David on on July 29 that cotton bandages used at Barlinnie prison for retaining dressings and found to be unsoiled after use were sent to the laundry where they were steeped in lysol and then thoroughly washed before being returned to the surgery for further use His information was that the conditions were hygienic but he would look into the point Soiled bandages were burned and no bandage which had been in contact with a wound was used again Gauze bandages were not used twice Replying to Mr Gallacher Mr Colville said that when a prisoner at Barlinnie was given medicine in his cell his own spoon was used It medicine was given in the surgery or washed the spoon was washed and dried with a towel on each occasion. Prisoners with infectious diseases were isolated and their own spoons used and then sterilized In the subsequent debate Mr Colville announced that it was expected that the new Criminal Lunatic Asylum for Scotland and the State Institution for Detectives would be ready for occupation next year

Regional Medical References—The number of incapacity and consultation references made by approved societies during 1937 to the regional medical staff in England and Wales was Dr Elliot states 459 606 During the year 128 621 insured persons received declaring off certificates before the date fixed for examination while 91 305 did not attend for examination 27 828 insured persons were examined and in the opinion of the examining officers 15,212 were incapable of work and 62 616 were not incapable of work

Working Hours of L.C.C. Nurses—Dr ELLIOT states that the London County Council decided on May 18 last that as from July 1 a ninety six hour fortnight should be substituted for the existing hours of work of nurses The scheme has been put into operation at a number of hospitals but it has not yet been possible to recruit the numbers of staff necessary to put it into full operation

Silicosis in Tin Miners—Between June 1 1931 and May 31 1938 the Silicosis Medical Board certified fifty tin miners to be disabled by the disease and certified in thirty seven cases that death was due to the disease In twenty five of the fatal cases the workmen had previously been certified to be disabled For the year ending May 31 1938 there were five fatal cases (four of which had previously been certified as disabled) and ten cases of disablement

Notes in Brief

On March 31 1938 as compared with October 1 1937 in spite of a fall of 28 000 in the number of children in the schools of England and Wales there was an increase of 74 000 in the number receiving free milk and of 99 000 in the number paying for milk

In 1937 the fatal accident rate to persons under 18 in coal mines was 0 89 per 1 000 employed and the reportable injury rate 5 86 per 1 000 The comparable rates in respect of persons of 18 years and over were for fatal accidents 1 09 per 1 000 and for reportable injuries 4 02 per 1 000

In 1937 compensation was paid under the Workmen's Compensation Acts for these new cases of industrial disease nystagmus 1 165 or 1 5 per 1 000 persons employed beat hand 1 212 or 1 5 per 1 000 beat knee 4 848 or 6 1 per 1 000 beat elbow 700 or 0 9 per 1 000 synovitis, 373 or 0.5 per 1 000 and other diseases 129 or 0.2 per 1 000 None of the cases was fatal

Sir Samuel Hoare stated on July 28 that he had received the report of the committee appointed to consider the evacuation of the civil population from certain areas in time of war He would take the matter up at once

Of 58,547 applicants for entry into the Royal Navy and Royal Marines for the year ended March 1938 22 029 were rejected on medical and dental grounds

In England and Wales during the six months ended March 31 last 181,944 houses were built which is a record for any half year

The number of disability pensioners at March 31 1938 was approximately 434 700

In England and Wales the majority of local education authorities who are conducting courses of instruction for

unemployed boys and girls have made arrangements for medical inspection either monthly or at more frequent intervals In Scotland until the passage of the Unemployment Insurance Act 1938 the powers of education authorities with regard to medical services at courses of instruction were limited to a general power to provide medical supervision It has not yet been possible for any authorities in Scotland to make arrangements under the new Act

EPIDEMIOLOGICAL NOTES

Poliomyelitis

The seasonal rise in England and Wales in the prevalence of acute poliomyelitis noted in the last two issues of the *Journal* continues, although the situation calls for no undue alarm During the week under review 41 cases were notified, compared with 19 in the previous week while in the corresponding week last year 17 cases were recorded Of the 41 cases one-half occurred in twenty different areas, ranging from Northumberland to Cornwall, while in no town were more than four cases notified during the week In the past three weeks 83 cases were notified with 9 deaths Cases were notified during the last three weeks in Braintree 17 (1 death) Halstead 19 Swansea 5 (1 death), Pontyates 4 (1 death), Farnham 4 (3 deaths), Grimsby and Cleethorpes 7 Reading 3 (1 death), Felstead 6, Worthing 9 (2 deaths) Ipswich 4 Ealing 1 Shildon 4 Although, generally speaking, the disease has been described as of average severity and in some areas distinctly mild the occurrence of 9 deaths among 83 cases notified points to the presence of infection of considerable and varying severity

Most deaths are due to respiratory failure from bulbar involvement, but the use of mechanical methods of artificial respiration has undoubtedly lowered the number of deaths Difficulties in connexion with the transport of respirators and the availability of electrical supply of suitable voltage can usually be overcome, but it is sometimes preferable to remove a patient to the machine rather than transport the apparatus to the patient, provided artificial respiration can be operated during the journey To most forms of apparatus a device is attached whereby the bellows may be operated by hand for considerable periods in case of an emergency The Bragg-Paul respirator is more readily transported and, generally speaking is easier to operate from the point of view of the control and nursing of the patient, while technical difficulties in working the apparatus have been overcome in recent models (See correspondence on the Bragg-Paul pulsator in the *Journal* of July 30, p 254) As regards prophylaxis, the avoidance of undue fatigue and exposure to infection, combined with the use of gargles, are the important matters Injection of immune serum (human or animal) need only be considered in very special circumstances where the disease is rife and exposure intimate The horse serum prepared at the Lister Institute (marketed by Messrs Allen and Hanburys, Ltd) has been shown to be more potent than convalescent serum and being readily available, should be used for prophylaxis While in treatment immune serum has not been proved definitely to be of value, it may be given to early cases in the pre-paralytic stage of the disease confirmed by the findings in the cerebrospinal fluid Convalescent serum when used should be administered by the intravenous route or combined intravenous and intrathecal routes

Typhoid Fever

During the week under review 32 cases of enteric fever were notified, compared with 19 in the previous week and 33 in the corresponding week last year The 32 cases were widely scattered in England and Wales the chief counties affected being Essex, 7 cases, West Riding, 5 cases In the week ended August 6 an outbreak occurred at Farnworth Lancashire in which 23 confirmed cases have been reported to date the number under observation is 14 So far there have been 2 deaths All the cases occurred in the New Bury area and are confined to a small group of houses in which several members of a single family have been involved in one or two instances Pending the results of bacteriological investigations the health authorities advise that both milk and water should be boiled The disease appears to have been of a serious type there having been 2 deaths among 23 cases

Diphtheria and Scarlet Fever*

Notifications of diphtheria in England and Wales during the week under review fell from 1 031 to 1 007 and in London from 155 to 154 There was also a drop in the notifications for Scotland—106 as against 123—but in Eire a slight rise was noted—46 compared with 45 in the previous week in Northern Ireland there was a considerable decrease 14 cases being notified compared with 37 in the previous week Deaths from diphtheria in the 126 Great Towns of England and Wales fell from 27 to 19 while in London they remained at 3 of the 19 deaths recorded in the 126 Great Towns 3 (0) occurred in Manchester and 2 each in South Shields (2) and Swansea (0) There were 4 deaths from diphtheria in the 16 principal towns of Scotland during the week—3 (3) in Glasgow and 1 (0) in Kilmarnock There was a drop in the notifications of scarlet fever in England and Wales and in London during the week under review—1 553, compared with 1 791 and 128 compared with 191 respectively both these figures were below the median values for the last nine years There were 5 deaths from scarlet fever in the 126 Great Towns during the week—1 each in London (1) Brighton (0) East bourne (0), Nottingham (0) Sunderland (0)

Primary and Influenzal Pneumonia

There was a decided increase in the notifications of primary and influenzal pneumonia in England and Wales during the week under review—589 as against 493—and in London—43 as against 33, both these figures are considerably in excess of the median values for the last nine years

Measles and Whooping-cough

Measles was responsible for 5 deaths in the 126 Great Towns of England and Wales during the week under review compared with 6 in the previous week of these 1 (2) occurred in London 2 (0) in West Ham and 1 each in Hendon (0) and Leeds (0) The average daily admissions to the L C C fever hospitals were 8 as against 11 in the previous week Notifications dropped in five of the metropolitan boroughs in which measles is notifiable remained the same in three, and rose in three Fulham 11 (7), St Pancras 10 (9) Stepney 2 (1) In Scotland the figures for measles dropped appreciably—62 compared with 117 in the previous week of these 31 (46) occurred in Kirkcaldy 20 (36) in Dunfermline 4 (5) in Dundee There were 14 cases of measles in Northern Ireland during the week all in Belfast In the 126 Great Towns of England and Wales there were 7 deaths from whooping cough during the week—the same as in the previous week only 1 of these occurred in London In Scotland 25 cases of whooping cough were recorded—18 (14) of which were in Glasgow—and 1 death (in Glasgow)

Cholera

During the week ended July 30, 121 cases of cholera and 244 deaths from this disease were reported in Shanghai, and in Hong Kong 25 cases with 26 deaths Increases in the incidence of cholera were noted in the Central Provinces—4 961 cases with 2 398 deaths—in Madras (Presidency)—374 cases with 170 deaths—and in the United Provinces—924 cases with 407 deaths

* In these paragraphs except where otherwise mentioned figures in parentheses refer to the week preceding the one under review

No 0

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended July 30 1938

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year for (a) England and Wales (London included) (b) London (administrative county) (c) Scotland (d) Eire (e) Northern Ireland Median values for the last 9 years for (a) and (b)

Figures of Births and Deaths and of Deaths recorded under each infectious disease are for (a) The 126 great towns (124 in 1937) in England and Wales (including London) (b) London (administrative county) (c) The 16 principal towns in Scotland (d) The 1[illegible] principal towns in Eire (e) The 10 principal towns (9 in 1937) in Northern Ireland

A dash — denotes no cases a blank space denotes disease not notifiable or no return available

Disease	1938					1937 (Corresponding Week)					1929–37 (Median Value Corresponding Weeks)	
	(a)	(b)	(c)	(d)	(e)	(a)	(b)	(c)	(d)	(e)	(a)	(b)
Cerebrospinal fever	26	1	10	2	1	11	2	10		—

Deaths	7	—	1	1	—	9	2	4	1	—		
Deaths (0–1 year)	272	49	52	34	11	296	59	55	24	20		
Infant mortality rate (per 1 000 live births)	45	40				50	49					
Deaths (excluding stillbirths)	3 814	718	511	160	109	3 727	683	557	155	104		
Annual death rate (per 1 000 persons living)	9 4	9 1	10 4	10 8	9 7	9 2	8 6	11 4	10 6	10 0		
Live births	6 819	1 248	888	373	294	7 085	1 220	849	317	235		
Annual rate per 1 000 persons living	16 8	15 9	18 1	25 3	26 1	17 5	15 4	17 4	21 6	22 5		
Stillbirths	249	33				288	53					
Rate per 1 000 total births (including stillborn)	35	26				39	42					

After October 1 1937 puerperal fever was made notifiable only in the administrative county of London.
† Death from puerperal sepsis.
‡ Includes primary form in figures for England and Wales London (administrative county) and Northern Ireland.

Medical News

In our advertisement columns this week applications are invited for the following posts University of London Chair of Radiology tenable at the Royal Cancer Hospital at a salary of £2 000 per annum and Conservator of the Museum and Director of Postgraduate Studies at the Royal College of Surgeons of Edinburgh at a salary of £1,000

The address of the Imperial Cancer Research Fund is now Burtonhole Lane, The Ridgeway Mill Hill N W 7 telephone, Mill Hill 3544

An Imperial Veterinary Conference will be held at the Royal Veterinary College Camden Town London, N W 1, from August 15 to 19 The subjects to be discussed will include the work of the Imperial Bureau of Animal Health foot-and mouth disease and certain other virus diseases Johne's disease bovine mastitis caseous lymphadenitis of sheep, sheep blowflies, fowl paralysis and chronic bovine haematuria

The official *Reichsgazette* of August 3 contains a decree depriving all Jewish doctors in Germany of their permit to practise medicine in that country and Austria with effect from September 30 next The Ministry of the Interior is given power to make exceptions in the case of doctors who served in the German Army during the war who are reduced to indigence by the new order After October 1 revocable permission will be given to certain Jewish doctors to treat Jewish patients only Landlords are required to give notice by August 15 to Jewish medical tenants who will have to leave their quarters by September 30 unless there is difficulty in replacing them with new tenants The effect of the decree will be felt most acutely in Vienna, where before the *Anschluss* over 50 per cent of all the practising doctors were Jewish Henceforth no Jewish practitioner deprived of his means of livelihood will be allowed to re enter the profession

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR BRITISH MEDICAL JOURNAL B M A HOUSE TAVISTOCK SQUARE W C 1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone, unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Secretary, B M A House Tavistock Square W C 1 on receipt of proofs Authors overseas should indicate on MSS if reprints are required, as proofs are not sent abroad

All communications with reference to ADVERTISEMENTS should be addressed to the Advertisement Manager Orders for copies of the *Journal* and communications with reference to subscriptions should be addressed to the Secretary B M A House, Tavistock Square W C 1

The TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111

The TELEGRAPHIC ADDRESSES are
EDITOR OF THE *BRITISH MEDICAL JOURNAL, Aitiology Westcent London*
SECRETARY *Medisecra Westcent London*

The address of the B M A Scottish Office is 7 Drumsheugh Gardens Edinburgh (telegrams *Associate Edinburgh* telephone 24361 Edinburgh) and of the Office of the Irish Free State Medical Union (I M A and B M A) 18 Kildare Street Dublin (telegrams *Bacillus Dublin* telephone 62550 Dublin)

QUERIES AND ANSWERS

Spasm of Colon

"M B OXON writes Are there any records of this condition being due to *B coli*? In this particular case no relief is given to the condition which troubles the patient chiefly by waking him up in the early hours of the morning by belladonna nerve sedatives or dieting This patient has for some years been subject to attacks of *B coli* bacillaemia which occur on the average once in twelve months Hence the question

Green Stools at 74

Dr J BARCROFT ANDERSON writes in reply to the inquiry published last week His 'Mewt' excluded mild aluminium poisoning as the cause of the green stools symptoms of occasional gastritis, notably some pain, especially at night ?

LETTERS, NOTES, ETC

Teaching of Obstetrics

Dr LEON KAHAN (Stepney) writes May I comment on Dr Edith Summerskill's statement in the House of Commons as it appeared in the lay press concerning the teaching of obstetrics in this country? I was taught obstetrics in a leading London hospital twenty five years ago and I and my colleagues had plenty of practical work all of us conducting thirty cases independently About twenty years later my son was taught midwifery at the same *hospital* and the method of teaching was the same Compared with other European universities (where I spent some time) the teaching of midwifery in this country is excellent particularly on the practical side It is a great pity that Dr Summerskill was not so fortunate and apparently according to her own statement did not show too much interest in her work Childbirth and child-bearing are natural functions and I suggest that any general practitioner is capable of attending confinements satisfactorily provided sufficient care is taken to prevent complications and if the latter do arise that they are dealt with carefully and promptly

Recovery after 1,500 Grains of Aspirin

Dr G S W EVANS (High Wycombe) writes The instances of aspirin poisoning recently described prompt me to relate the following experience One day about noon an agitated man rushed into a shop where I was making a purchase and urged me to accompany him to an adjacent house where his son had swallowed 300 aspirin tablets There on a couch lay a youth of about 20 in a semi comatose condition and the production of empty bottles *confirmed* the fact that he had taken 1 500 grains of aspirin *It* seemed that the performance of this feat had occupied *two* hours *or more* I was able to induce the patient to drink an ounce of mustard in water and thus brought on profuse vomiting which continued during his conveyance to hospital where I believe the stomach was washed out For some days afterwards the boy suffered from tinnitus flashes of light before the eyes irregularity of the heart and a full of blood pressure but he recovered I am indebted to Dr English of Crewe for the details of the progress of the patient in hospital

The Evolutionary Theory

Surgeon Rear Admiral C M BRADNELL writes The accusations of forgery and faking repeatedly made against Haeckel are so unjustifiable that I hope you will permit me a second reply to Colonel G F Rowcroft, *D S O* (*Journal* June 25 p 1406) Haeckel admittedly schematized a few of his representations of embryos not for purposes of deception however but in order to help students and others by emphasizing essential features and impressing points of similarity in the different classes of vertebrate *embryos* Alongside his own drawings and diagrams he frequently placed those of other embryologists by way of corroboration To be logical to and consistent with these anti evolutionist contentions we should have to regard every illustrated book on astronomy, physiology, or other branch of science as epitomes of fraud Even the excellent photographs and skiagrams so often depicted in the pages of the *British Medical Journal* would fall within this category for they have forced into two dimensions of space objects that in reality occupied three! When Dr Brass—upon whose own scientific work Professors Hertwig and Keibel passed severe strictures—first published his accusations against Haeckel the latter, declining at first to take them seriously ironically replied that 'six or eight per cent" of his illustrations had been thus 'falsified, but, as he stated later in the *Berliner Volkszeitung* of December 29, 1908 these so called 'falsifications were what practically all scientific men did when illustrating their works In conclusion may I recall that when, immediately following Dr Brass's accusation forty-six of Germany's leading scientists signed a protest repudiating the charge one of them the eminent embryologist Professor Rabl pointed out in the *Frankfurterzeitung* of March 15, 1909 that Dr Brass himself had been guilty of the very practice which he had so unjustly endeavoured to foist upon Professor Haeckel

KEY TO CURRENT MEDICAL LITERATURE

GENERAL JOURNALS

Deutsche Medizinische Wochenschrift

Leipzig vol 64 June 3 1938

Twenty Five Years of Treatment of Trigeminal Neuralgia with Gasserian Injections—F Härtel
Significance of Meteorism in Pneumonia—O H Mayrhofer and Schulz
Death after Bismuth Treatment with Remarks on a Localized Serological Index for Treatment of Syphilis—H Arntz
Familial Factors Malformed Children Heredity Researches in 109 Families into the Factor Nature—P Dahr and W Bussmann
Local Cure of Trigeminal Neuralgia by Injections of Alcohol—D Kulenkampff
Can Extraneous Factors Appreciably Influence Development of Multiple Sclerosis?—H Sturzberg
Reflex Pain due to Myogelosis—A Reichardt
What Must the General Practitioner Know of Electrocardiography?—G Biedermann
Principles of Evaluation of Biologically Potent Substances—H v Schelling

Meteorism in Pneumonia—An account is given of what is done in a public hospital in Konigsberg Prussia to break the vicious circle which arises when meteorism develops in the course of a pneumonia It is stated that in the overwhelming majority of fatal cases of croupous pneumonia meteorism begins and is refractory to treatment

Edinburgh Medical Journal

Edinburgh vol 45 April 1938

Suicide—D K Henderson
Modern Anaesthesia and the General Practitioner of To-morrow—I Gillies
Mixed Tumours of Salivary Glands—W F Harvey E K Dawson and J R M Innes
Myocardial Infarction Pathological Study—R M Murray Lyon
Moscow Skiff of by Institute—D Band
Preventive Medicine and Control and Treatment of Tuberculosis as seen in Soviet Russia—W T Munro
Surgical Treatment of Cardiac Pain—J Paterson-Ross
Case of Unruptured Tubal Pregnancy continuing to Full Term—H Miller

Myocardial Infarction—Murray Lyon reports that evidence of myocardial infarction was found in 110 cases out of 3 200 consecutive necropsies an incidence of 3 44 per cent An unusually high proportion of female cases was found—36 4 per cent Thrombosis was the cause of the infarction in all cases except three of mitral stenosis in which embolism had occurred The right ventricle was involved in only five out of 122 infarcts Approximately three fourths of the male cases had been diagnosed before death but only half the female cases About half the patients died within one month of their acute attack

Edinburgh vol 45 May 1938

Medical Practice of the Future—J Purves-Stewart
Psychological Problem of Venereal Disease—R C L Batcheler
Lung and Pleura Certain Anatomical Facts in Relation to Disease—A Fergus Hewat
Nasal Sinusitis and Mental Disorder—A B Smith and C McD Ross
Benign Intrathoracic Tumours—E Bloch
Milk Supply—A S M Macgregor
Highland and Islands Medical Service—A Sheater
Treatment of Chronic Cervicitis—G D Matthew

Nasal Sinusitis and Mental Disorder—As the result of complete examination of the nose throat and ears in 818 cases of mental disorder Smith and Ross found that 12 per cent of these patients suffered from nasal sinusitis They found no evidence that nasal sinus infection plays any fundamental part in the causation of the majority of cases of mental disorder

Journal of the American Medical Association

Chicago vol 110 June 4 1938

Excretion of Sulphanilamide—J D Stewart G Rake and J G Allen
Use of Sulphanilamide after Transurethral Prostatectomy—H Gauvain H A Zide and G Thompson
Use of Benzedrine Sulphate in Post-encephalitic Parkinsonism—P L Davis and W B Stewart
Fracture of Atlas in Automobile Accidents—H F Plaut
Fatality Rates in Cerebrospinal Meningitis—G W Loth
Vitamin C in Blood Spinal Fluid and Urine—H Wortis J Liebmann and E Wortis
Cystic Hygroma of Neck—B L Fleming
Studies in Evaluation of Mammography—R A Reisford S D Mesrow
Limitations and Dangers of Mammography by Contrast Media—S A Robinson and E M M Fetterolf
Multiple Peripheral Neuropathy in Multiple Neuritis—I S Wechsler
Vitamin A Requirements and Practical Recommendations for Vitamin A Intake—L E Poeltzer

Klinische Wochenschrift

Berlin vol 17 June 4 1938

Function and Significance of Mineral Substances—H Glatzel
Hormonal Changes in Newborn Infant—E Philipp
Effect of X Rays on Structure and Function of Anterior Lobe of Pituitary—P Crumbecht F Keller and A Loeser
Reducing Capacity of Dehydroascorbic Acid in Healthy Individuals and Patients suffering from Chronic Haemorrhagic Intestinal Affections—H Lund and A Elmby
Practical Importance of Bio-electrical Groups—R Keller
Island-cell Adenoma successfully Removed by Operation—G W Paraskevas and K Kinder
Effect of Allylformate on Fatigue Curve of Isolated Cardiac Muscle of Frog—B Zawadzki
Comparative Therapeutic Investigations on Effect of Nerium (Oleander) on Cardiovascular Affections—H Becker Freyseng
Humoral Transmission of Cellular Changes—B Esler
Behavioural Effect of Complex Molecular Compounds of Albuminous Substances—B Esler

Effect of X Rays on Anterior Pituitary—The anatomical structure of the hypophysis is not affected even by very intensive irradiation There is also no appreciable change in the thyrotropic and gonadotropic hormones of the pituitary after a single irradiation

Lancet

London vol 234 June 4 1938

Causation and Treatment of Dermatitis—R Hallam
Sulphanilamide in Treatment of Meningococcal Meningitis—E C O Jewesbury
Surgical Treatment of Pituitary Basophilism—A R D Pattison and W G A Swan
Active Immunization against Epidemic Influenza by Elementary Body Suspensions heated at 57° C—R W Fairbrother
Reticulocyte Response in Albino Rats after Injection of Gastric Juice—G Plaut

Sulphanilamide—Six particularly severe cases of meningococcal meningitis are described successfully treated by sulphanilamide in combination with antiserum or antitoxin Recent reports from America and England are summarized. The question of the best route for administration of the drug, like that of the advisability of giving it in addition to antiserum or antitoxin still remains undecided

Pituitary Basophilism—The writers summarize the symptoms of pituitary basophilism mention the extrapituitary conditions which may simulate it and recall the cytoplasmic changes described in those presenting the syndrome in the non-neoplastic ripe basophil cells The importance of searching, in the first place for an adrenal cortical tumour is emphasized Two cases of Cushing's syndrome in young women are described in which improvement followed the insertion of radon seeds into the sella turcica

Medical Journal of Australia

Sydney vol 1 May 14 1938

Medical Men as Exposers—L Dureau
Cateterism of Cervix from Viewpoint of General Practitioner—F B Crane
Physical Therapy in Oto-Laryngology—E Gutterdge
Adhesions in and around Joints—N Little.
Migraine from the Allergic Viewpoint—C Sippe
Note on Effect of Thoracic Administration on an Implanted Tumour of the Mouse—W Meppett.

Medizinische Klinik

Berlin vol 34 June 3 1938

Problem of Viruses —K Herzberg
Task of General Practitioner in Cases of Haemoptysis —O Schedtler W Starlinger Cobet G Schroder and A Biemeister
Aetiology of Chronic Bronchiectasis —W Neumann
Spontaneous Pneumothorax —H Alexander
*Radiographic Demonstration of Pulmonary Tuberculosis in Pleurisy with Effusion —I Kuhlmann
Gold diasporal Therapy in Tuberculosis —A Sattler
Agranulocytic Reaction —K Kummerling

Pleurisy with Effusion —This paper stresses the importance of small, mostly infraclavicular and posteriorly situated tuberculous foci in cases of apparently primary pleurisy An outline of the most suitable radiographic technique for the demonstration of these foci is described Pleural puncture has become superfluous thanks to systematic radiographic examination

Medizinische Welt

Berlin vol 12 June 4 1938

Problems of Nutrition in Infection with Examples from Rheumatic Polyarthritis —H Lotze
Serological Blood Picture during Termination of Syphilitic Infection —P W Schmidt
*The Gulf Disease —B zu Jeddeloh
Otogenous Sinus Thrombosis and its Cerebral Complications —H Richter
Lowered Cardiac Vitality and Complete Cardiac Failure —K Barth
Eifelfango Treatment in Orthopaedics —K Ullmann
Treatment of Chronic Eczema of External Ear —G Ullrich

The Gulf Disease —B zu Jeddeloh describes a disease involving damage of the skeletal musculature which occurs chiefly round the eastern bays and gulfs of Germany Of some 500 notified cases only twenty-five lived more than a mile from the sea The aetiology is unknown, and its elucidation is particularly difficult as no cases have occurred since 1933 Gulf disease begins suddenly with pain in all the muscles, movement is impossible The general condition is excellent, there is no fever or catarrhal infection of the respiratory passages The muscles remain soft and are tender No histological changes in the muscles were found in many cases at necropsy but a nephrosis is present The urine is coffee brown owing to myochrome, albumin is present creatine is increased and cylinders are found The prognosis in most cases is good

Munchener Medizinische Wochenschrift

Munich vol 85 June 3 1938

Co operation between Tuberculosis Dispensary Hospital Ward and Sanatorium —Griesbach
Results of Planned Anti tuberculosis Campaigns —L Schuler
Treatment of Haemoptysis in Tuberculosis —F Roll
*Occurrence of Chlorosis in the Male —W Beckert
Cause of Labour Pains and their Importance in Management of Labour —W Wolf
Treatment of Pain after Tonsillectomy —G Heddaeus
New Principle in Treatment of Idiopathic Trigeminal Neuralgia —O Meyer
Observations on a Scarlet Fever Epidemic in Pinneberg (1937) —O Boyksen
Familial Occurrence of Echinococcus Disease —G Marangos
Treatment of Empyema —R Klahn
Conglomeration and Sedimentation Rate of Erythrocytes —G Niedegken

Chlorosis in the Male —Beckert observed two male adolescents with typical chlorosis The symptoms results of clinical examination blood picture and cure after iron therapy were all exactly as seen in chlorosis No cause for the anaemia was ascertained

Nature

London vol 141 June 4 1938

Sir Frederick Gowland Hopkins —H Wieland
The Florisbad Skull —A Keith
Photochemical Interaction between Ketones and Secondary Alcohol —Ch Weizmann Y Hirshberg and E Bergmann
Overtrophic and Folliculoplasic Hormone —J Freud
Hormone and Action of Thyroid Gland —F Ellinger
Development of Giant Salivary Gland Nuclei of *Drosophila* —S L Frolova

New England Journal of Medicine

Boston vol 218 June 2 1938

Passing of Surgical Yeomen —A G Rice
Relation of Newer Drugs to Public Health —G P Grabfield
Medico-legal Examination of Hairs —B M Vance
*Progress in Diabetes Mellitus —H F Root and A Marble

Progress in Diabetes Mellitus —This is a summary of the literature which has appeared during the past year It contains an account of the uses of the newer insulins, such as protamine zinc insulin and calcium insulin A full list of references is appended

Nordisk Medicinsk Tidskrift

Stockholm vol 15 June 4 1938

Electro encephalography —G Ehrenward and T S Frey
*New Viewpoints in estimating Value of Treatment of Schizophrenia with Insulin Comparative Study of 200 Cases given Ordinary Clinical Treatment —G Langfeldt
Treatment of Varicose Veins with Injections of Varicocid (Sodium Morrhuate) —A Tallroth
Arteries in Myo-endometrial Zone of Human Uterus —H Okkels

Prognosis of Schizophrenia —Follow up study showed that when schizophrenia was well defined a permanent cure could be claimed in only 3 per cent whereas among the ill defined uncertain cases the complete recovery rate was 32 per cent and the partial recovery rate 35 per cent Hence the importance of distinguishing between well defined and ill defined schizophrenia from the outset before attempting a prognosis or forming an opinion of the therapeutic value of insulin shock

Policlinico

Rome vol 45 May 30 1938 (Sez Prat)

*Oxalic Acid Metabolism in Gout —I Di Marco
Ten Years Practice in Pneumothorax —E Mondolfo and R Molari
First Cases of Intestinal Schistosomiasis from *Schistosoma mansoni* in Libya —E Cicchitto
Early Getting Up and Early Alimentation after Operations —V Pettinari

Gout —Of forty-four cases of typical gout Di Marco noted an increased oxaluria in 88 per cent usually combined with an increase in the urinary oxalates He suggests that the oxalic acid is here largely derived from excess of uric acid hepatic metabolization of this being defective and leading to the appearance in increased amounts of the intermediate product

Presse Medicale

Paris vol 46 June 1 1938

*Instability of Vago sympathetic System and Operations on Sympathetic in Course of Pulmonary Tuberculosis —L Michon J Chaze and R Mollard
*Aerophagy —G Leven
Reflexotherapy of Neurotonic Reactions —L Alquier

Vago-sympathetic Instability in Phthisis —The authors as the result of five years research have come to the conclusion that vago sympathetic instability accounts for many of the subsidiary factors in pulmonary tuberculosis such as vaso motor, inflammatory and other perifocal phenomena the importance of which in prognosis is being increasingly realized They also point out that laboratory experiments have shown that the toxin of tuberculosis is a definite vago sympathetic poison Hence their object has been to endeavour to stabilize the sympathetic system or at least to render it less unstable For this purpose they use the method of injecting a weak solution of novocain into the stellate and/or the second third fourth and fifth thoracic ganglia They describe their technique and give examples of cases so treated

Aerophagy —The author is disturbed by recent publications in France and other countries tending to deny the existence or significance of aerophagy He gives examples drawn from the realms of surgery obstetrics, medicine and

radiology to prove the importance of this symptom and discusses its aetiology and treatment

Paris vol 45 June 4 1938

Place of Systematic X Ray Examinations in Early Detection of Pulmonary Tuberculosis in Communities—L Jullien
Some Numerical Data on Lumbar Sympathetic Chain (Ganglia)—V Desmaisons and R Porcher

Systematic X Ray Examinations—Jullien says the result of eleven years systematic x ray examinations in the French Army puts forward a plea for the adoption of the same methods in school children and young people The examination should be first by screening and then by films where necessary The author gives his reasons for preferring this to all other methods for the early detection of tuberculosis He describes an ingenious portable x ray apparatus

Schweizerische Medizinische Wochenschrift

Basle vol 68 June 4 1938

Meningitis of Unusual Causation (Pasteurella Meningitis)—W Hadorn
New Case of Cerebrospinal Meningitis from *B bipolaris septicus*—R Regamey
Chemotherapy of Acute Anterior Poliomyelitis—C Contat
Bengal pink and Other Tests of Hepatic Function—M Navill

Pasteurella Meningitis—In this and the succeeding paper the clinical features and bacteriological findings are described of a case of meningitis due to an organism of the Pasteurella group (*B bipolaris septicus*) The bacteriological relationships are discussed The illness followed some months after a fracture of the frontal bone and in spite of a frankly purulent cerebrospinal fluid took a benign course

Chemotherapy of Poliomyelitis—Contat had no mortality as well as a favourable course and satisfactory end results *qua* paresis in fifty four cases during the recent Swiss epidemic He used potassium chlorate both orally in doses larger than are customary and in nasal instillations The prophylactic and therapeutic properties as well as the toxicology and dosage of the drug are discussed fully

South African Medical Journal

Capetown vol 12 May 28 1938

Intravenous Treatment of Varicose Veins—R Simons
Endemic Focus of Plague—L Feurie
Case of Cerebral Tumour—I Sacks
Three Interesting Cases of Bilharzial Infection in a Family—P Klenerman

Ugeskrift for Laeger

Copenhagen vol 100 June 1938

Sanatory in Treatment of Diseases of Joints with Special Reference to Compensation of Treatment—K Secher
Polyarthritis Urethritica Simplex in Four Patients—S Clemmesen and K Kabbak
Osteoarthritis treated with Immetal Injection—H Jacobsen

Immetal—In 1932 W Konig published in the *Zentralblatt fur Chirurgie* a communication on the subject of a substance immetal he had produced which resembled in consistency the fluid normally found in a joint and which could remain in that fluid for a long time without doing any harm Jacobsen gives an account of twelve of his own cases treated with injections of this substance In all but one case the immediate or ultimate results were good

Wiener Klinische Wochenschrift

Vienna vol 51 June 5 1938

Effect of Structure of Bile Ducts on Gall bladder—K Budinger
Treatment of Migraine—R Ustvedt
Treatment of Lambliosis—P Gruneis
Forensic Medicine in Relation to Schizophrenia—J Berze
Fischer Bowman Pregnancy Test—B v Bedő
Cancer Mortality and Social Status—G Wolff
Clinical Significance of Examination of Morphology and Number of Blood Platelets—L Bacher
Results in Differentiation of Brucella Types according to Izar and Famulari—K Kollár
Treatment of Angina Pectoris and Cardiac Asthma—H Siedek
Therapeutic Importance of Vitamins in Obstetrics and Gynaecology—J Gigon

Treatment of Lambliosis—Gruneis reports on three cases of lambliosis successfully treated with three tablets daily of atebrin for five days At the end of treatment the faeces and duodenal secretion were free from parasites Treatment is simple without danger and can be repeated if necessary

Wiener Medizinische Wochenschrift

Vienna vol 88 June 4 1938

Elimination of Phrenic Nerve in Collapse Therapy of Pulmonary Tuberculosis—A Sattler
Therapy of Diseases caused by Worms—O Charousek
Importance of Blood Circulation in Abdominal Surgery and its Consequences—R Friedrich
Practical Therapy of Leucorrhoea—W Hacker

SPECIAL JOURNALS

American Journal of Diseases of Children

Chicago vol 55 May 1938

Rheumatic Erythema Nodosum—A Walgren
Metabolism and Mode of Action of Vitamin D Importance of Liver for its Antirachitic Efficacy—W Heymann
Results of Collapse Therapy in Children with Pulmonary Tuberculosis—M Siegel and B Sniffer
Pathogenesis and Treatment of Myotonia Congenita Further Observations—H G Poncher and H W Wade
Insensible Loss of Weight in Infancy Findings for Forty six Infants under Basal Condition—J L Law and W G Frederick
Diagnosis of Syphilis in Newborn Infants Use of Quantitative Wassermann Tests—A L Christie
Mentality of Infants Relieved of Hydrocephalus by Coagulation of Choroid Plexuses—T J Putnam
Pathology of Chronic Arthritis of Children (Still's Disease)—R B Portis

Rheumatic Erythema Nodosum—A case of this condition is described in detail and proves the correctness of the view that acute rheumatic fever may give rise to erythema nodosum On the other hand the rarity of such cases disproves the view that erythema nodosum is often rheumatic

Collapse Therapy—An account of the pneumothorax treatment of pulmonary tuberculosis in children is given and the results are analysed Many children improved and life was prolonged The best results were obtained among the children with unilateral tuberculosis in whom a marked degree of collapse could be obtained

American Journal of Psychiatry

San Francisco vol 94 March 1938

Habeas Corpus Releases of Feeble-minded Persons and their Consequences—Leo Kanner
Experimental Neurosis and Problem of Mental Disorder—H S Liddell
Intro-extraversion The Concepts and their Clinical Use—R M Collier and Minna Emch
Appraisal of Intellectual and Physical Factors after Cerebral Damage in Children—Bronson Crothers and Elizabeth Lord
Other Side of Hallucinations—Jonathan Lane
Review of Results from Employment of Malaria Therapy in Treatment of Neurosyphilis in Florida State Hospital—Mark F Boyd W K Stratman-Thomas S F Kitchen and W H Kupper
Hereditary Form of Primary Parenchymatous Atrophy of Cerebellar Cortex Associated with Mental Deterioration—Andrew J Akelaitis
Constructive Criticism of Certain Hospital Procedures—Karl M Bowman
Statistical Contribution from Mental Hygiene Study of Eastern Health District of Baltimore.—B M Cohen and R E Fairbank
Diagnostic Validity of Rorschach Test—J D Benjamin and F G Brough
Some Clinical and Physiological Aspects of Brain Potentials—J Hughes E A Strecker and K E Appel
Post-operative Psychoses—Milton M Abeles

*Results of Fifteen Years Experience with Ketogenic Diet in Treatment of Epilepsy in Children—H I Helmholz and M Goldstein
Some Data of Psychic Morbidity of Jews and Arabs in Palestine—I Halpern
Psychiatric History and Development in California—M H Smyth

Intro-extraversion—The authors record a careful study conducted upon 250 psychologists and psychiatrists in order to find out the consensus of professional opinion regarding the traits of introversion and extraversion As they state very mildly The lack of clear-cut associations with either introversion or extraversion was evident and they back up their conclusions with overwhelming statistical evidence

Mental Hygiene Study—The authors give a general account of a most valuable statistical inquiry into the mental health of a selected district of Baltimore

Ketogenic Diet in Epilepsy—The authors report favourably upon the value of the ketogenic diet in the treatment of idiopathic epilepsy and found that only 5 to 10 per cent of those who became free from attacks following its use had any recurrence of seizures in a period of seven years They believe that after such an interval the chances of recurrence are slight

Effects of Placental Extract on Course of Experimental Rabbit Syphilis—J E Kemp Clarence Shaw and E M Fitzgerald
Depigmentation of Iris in Experimental Rabbit Syphilis—W E Coutts and J M Herrera

Complement Fixation—Weiss and Arnold have developed a new technique for the complement-fixation test for gonorrhœa basing their argument on the fact that since serum from gonorrhœal patients contains relatively small amounts of antibody it is necessary to use large amounts of serum The antigen consisted of a simple suspension of many strains of gonococci For the test proper they use 2 c.cm of the serum to be tested, 0·15 c.cm of undiluted complement and the amount of antigen determined by previous titration with saline to make up to 2·35 c.cm After incubation for one hour at 37° C five units of amboceptor in 0·1 c.cm saline and 0·05 c.cm of a 50 per cent suspension of sheep's cells are added The authors claim that the only non-specific results occur with sera from cases of epidemic meningitis

Sulphanilamide and Laboratory Diagnosis—W Ray Jones states that sulphanilamide may revolutionize the laboratory identification of gonococci Films taken from patients treated with sulphanilamide show that pus and epithelial cells are more degenerate and more extraneous organisms are present, while the gonococcus shows changed physical and staining characteristics and a varied relationship to the cells The drug may also mask the presence of the disease since it may reduce symptoms without killing off all the gonococci Great care therefore should be exercised in examining films from sulphanilamide treated cases Drug-counter prescribing of the drug produces carriers and may not cure and in Washington it has not reduced the incidence of gonorrhœa

Intra-arterial Bismuth—Kimberly points out that the intra-arterial injection of bismuth is a rare but serious accident He describes a case of embolism due to bismuth being injected into an artery A male aged 31 suffering from syphilis was given his seventeenth intramuscular injection of a 10 per cent suspension of bismuth subsalicylate in oil He experienced a sharp pain in the buttock radiating down the thigh and leg Radiographs showed bismuth in the arterioles of the penis and part of the glans and scrotum sloughed Five weeks later there was still evidence of injury to the sciatic nerve toe and ankle drop absent Achilles reflex flabbiness of the left calf and hypo-æsthesia on the outer aspect of the leg and foot After an interval of eight weeks the neurological condition though still present was improved

Three Cases of Chronic Pancreatitis with Atypical Courses—J Lorié

Volvulus of Stomach—The condition is a torsion of part of the stomach in either the longitudinal or the transverse direction thus one part of the anterior stomach wall is made to face part of its posterior wall In acute cases x-ray investigation is useless and surgical intervention is indicated, in spite

of treatment 50 per cent of the patients die In the chronic cases or with the intermittent occurrence of volvulus medical treatment is justifiable The freely movable volvulus is caused by intestinal pneumatosis cases of fixed volvulus by adhesions and perigastritis

Archives d'Ophtalmologie

Paris vol 2 May 1938

Intracranial Study of Lymphs and Centres of Conjugate Movement—E Jayle
Case of Intracranial Compression of Optic Nerve—P Desvignes
Haemorrhagic Familial Angiomatosis and its Ocular Complications—J Francois

Familial Haemorrhagic Angiomatosis—First described by Rendu in 1896 and more definitely by Osler in 1901 this condition has three outstanding features telangiectasis haemorrhage and familial cataract Telangiectases appearing at 20 to 40 years of age are found on the skin or the mucous membranes the former more frequently on the face the latter in the nose haemorrhages occurring spontaneously or after some trifling accident may be copious the cataract is a constant feature Examination of the blood shows nothing unusual Death from anaemia may follow frequent haemorrhages The vessels of the telangiectasis have an irregular lumen with a simple endothelial lining and a deficiency or absence of elastic tissue Venous ectasias and varicosities in the retina observed in the reported case may have no connexion with the condition There is no specific treatment and local diathermy with the formation of a sufficient scar is followed by the appearance of a further telangiectasis at the same spot in a few days

Anteposition Conjunctivae Fornicis Operation in Severe Cases of Senile Catarrh—N I Shimkin
Case of Aniridia Reunae—I Fer
Microstructure of Epithelial Cells and its Importance for Aetiology of Trachoma—W Gruter

Corneo scleral Suture—This suture prevents post operative hyphaemia and prolapse of the iris It is of great value when prolapse of the vitreous is to be expected There are no after effects from the suture The needle speculum and technique are fully described The procedure may be used in both intra- and extracapsular extraction

Intracapsular Expression of Cataract—This is a modification of Smith's method A small iridectomy is made after the section and the behaviour of the cornea and the irido lenticular diaphragm observed Where the cornea collapses or the irido lenticular diaphragm remains in its normal position easy delivery of the lens may be expected This operation reduces intra ocular instrumentation to a minimum and no second operation is required

Case of Primary Bilateral Aniridia Clinical and Histological Report—E. Recordon and G M Griffiths
Modified Briggs's Retractor for Dacryocystorhinotomy—H B Stallard

Epidemic Dropsy Glaucoma—Epidemic dropsy being the only general disease at present known of which glaucoma is a feature it provides valuable material for research into the causation of glaucoma The anterior chamber being deep the vitreous does not swell in these cases Changes occur in the aqueous the albuminous content being raised Investigation of the osmotic pressure of the aqueous in epidemic dropsy shows that the change in the permeability of the capillaries does not affect the usual process of dialysation of aqueous from the blood but only alters the state of equilibrium setting it at a different level

Retinitis Pigmentosa—Many workers believe that retinitis pigmentosa has an endocrine origin Freshly passed urine of eight adult mentally defective patients with this disease was made just alkaline to litmus with N/10 sodium hydroxide placed in a boiling water bath for half an hour and allowed to cool in the dark When 0·3 to 1 c.cm. of this urine was injected into the dorsal lymph sac of frogs an increase of pigmentation was brought about varying from one frog to another Protein freed blood produced similar results but injections of cerebrospinal fluid had no effect A more constant result was obtained by immersing fresh frog skin in the urine Only certain cases of pregnancy and perhaps cases of abnormal skin pigmentation hyperthyroidism and pituitary disease give similar results Three of the eight patients had signs of pituitary dysfunction

Large Pedunculated Fibroma of Kidney—T B Mouat
Case of Heminephrectomy for Hematuria—H Meade
Necrosis of Anterior Wall of Urinary Bladder—an Unusual Complication after Resection of Bladder Neck Treatment and Prevention—M Graf

Tuberculous Epididymitis—Evidence is given in favour of the pathway of tuberculous infection within the genito urinary tract being from blood stream to kidney thence to the bladder by the urinary stream and from the posterior urethra to the epididymis by the lumen of the vas The higher incidence in recent statistics of renal lesions associated with genital lesions is believed to be due to improved facilities

for investigation and to better follow up methods In the author's series of cases there were associated renal and genital lesions in at least thirty proved cases out of fifty-five The cases of epididymitis without demonstrable renal lesions are explained by the presumption that the renal lesion has healed of which possibility provided that the lesion is merely microscopic there is recent evidence Clinically demonstrable lesions never heal and call for nephrectomy On this theory it became necessary in every case of tuberculous epididymitis to suspect the presence of a renal lesion and therefore repeatedly to examine the urine to carry out guinea-pig inoculation tests and to investigate fully the upper urinary tract It is suggested that prophylactic vasotomy on the healthy side should be performed (*a*) in old age (*b*) when one testicle has been completely lost or needlessly sacrificed, and (*c*) in the presence of frank prostatitis and vesiculitis

Tests of Renal Function—The following tests are considered the rate of secretion and concentration of urine the water excretion test the urea concentration test the urea range test the urea clearance test and tests based on the excretion of foreign substances As a test of total renal efficiency the urea clearance test is recommended while the single test giving the maximum amount of information is probably the phenolsulphonephthalein test

*Further Experiences with Vinesthene Anæsthesia—I S Raydin E L Elkason G M Coates T B Halloway K L Ferguson A B Gill and T J Cook

Spinal Anaesthesia—Spinal anaesthesia is the method of choice for all operations below the diaphragm and should be more widely used Pantocaine and percaine give prolonged analgesia and are the best agents the former for low and the latter in 1 1 500 strength (Howard Jones) for high analgesia A test is described for estimating the behaviour and effectiveness of the drug the latter depending on the alkalinity of the cerebrospinal fluid A few drops of the solution to be used are added to a little cerebrospinal fluid in a test tube The formation of a precipitate indicates an alkaline fluid, in which the drug will be effective, the behaviour of the precipitate—floating, sinking or diffusing—enables the distribution of the injection to be predicted If N/10 sodium hydroxide must be added before precipitation occurs the action of the drug will be weak or delayed

Abdominal Surgery—Reflex disturbances of the sympathetic nervous system occurring during surgical manipulations in the neighbourhood of the coeliac plexus are discussed and have been studied experimentally As occurring during upper abdominal surgery these result in abdominal rigidity and a severe fall in pulse pressure Physostigmine is suggested for pre anæsthetic administration also for treatment of the condition during operation

Vinesthene—Divinyl ether (vinesthene) continues to be used to an increasing extent for short anaesthesias in all branches of surgery with very satisfactory results It has completely replaced nitrous oxide-oxygen for the short operations of the surgical out patient clinic

Epidemic Encephalitis and Tuberculous Meningitis (Ger)—K Kotorai
Studies on Pancreatic Lipase (Eng)—I Nakamura
Experimental Examination of Local Disorders in Lung Circulation (Ger)—T Ikeda

Histamine and Burn Toxins—An increase of histamine is found in the organs of dogs after experimental burns have been inflicted This is highest (seven to ten times the normal figure) in the spleen the kidney, and the pancreas, and is noticeable in the blood from six to twelve hours after the infliction of the burn increasing up to the second or third day and then gradually decreasing If the damaged skin is cut out immediately after the burn is inflicted no increase in the histamine occurs and no signs of a toxic effect were noticed This seems to show that histamine is formed locally and distributed by the circulation The same observation was made in four clinical cases

Changes in Adrenals—There is a decrease in the chromaffin and in the amount of adrenaline in the adrenal medulla in both burns and histamine poisoning The clinical signs and histological changes are similar in both conditions Histamine is probably an important factor in the toxin production in burns and alterations in the adrenal glands are the probable cause of death in the fatal cases

† "Eng" means that the article referred to is printed in English, "Fr" in French, and "Ger" in German

Journal of Laryngology and Otology

London vol 53 June 1938

Some Clinical Aspect of Vocal Cord Inactivation.—H. Tilley
Administration of a Hearing Aid Clinic.—P. J. Kerrigan
Tetanoid Tremor of Nasopharynx.—W. H. Frith

Local Cord Paralysis.—The author describes a group of cases of left vocal cord paralysis in many of which a spontaneous recovery took place contrary to orthodox medical teaching. The left recurrent nerve is said to be more vulnerable than the right on account of its longer anatomical course peripheral neuritis will therefore be more common on the left side than on the right

Journal of Nervous and Mental Disease

New York vol 87 May 1938

Is there a Relative Increase in Mental Disease?—Benjamin Malzberg
Blood Pressure and Pulse Rate in Primary Psychoses.—Rudolph Schwartz
Irrigation in Treatment of Acute Mania.—L. C. Grosh
Effect of Induced Metrazol Convulsions on Schizophrenic Patient.—Hans H. Reese, A. H. VanderVeer and A. H. Weed
Psychosexual Effect of Benzedrine Sulphate.—Paul Schilder
Concentrations of Athletes, Catatonia and Hypochondriacal Schizophrenia.—Kalman Cyarfas
Electroencephalography in Dementia Praecox and Localization of Intracranial Conditions.—Theodore J. Case

Relative Increase in Mental Disease.—As the result of an examination of the available statistics in the State of New York the author concludes that there is a relative increase in mental disease but that this increase is on the whole moderate and must be viewed as part of a general trend extending over many generations. It is not such as to give rise to considerable eugenic concern.

Insulin Treatment.—The author gives a brief review of the controversial question of glucose tolerance tests in the manic depressive psychoses. He records good effects following treatment with insulin in two cases of acute elation which showed unusual reactions to glucose tolerance tests and suggests that similar treatment might be advised in other acute elations showing a similar abnormality of glucose tolerance.

Induced Metrazol Convulsions.—The authors report the results obtained in twenty patients treated with metrazol (cardiazol) and express the opinion that catatonic schizophrenics in the early negativistic stuporous phases seem to be the most suitable subjects for this form of treatment.

Journal of Nutrition

Effect of Urea on Human Respiratory Exchange and Alveolar Carbon Dioxide.—T. M. Carpenter
Basal Metabolism in Pregnancy.—J. A. Johnston, H. A. Hunscher, F. C. Hummel, M. F. Bates, P. Bonner and I. G. Macy

Vitamin B and Appetite.—The factors affecting appetite and food consumption especially the effect of vitamin B intake were studied in fifty four children aged 4 to 11 years. When the daily vitamin B intake was increased by about 50 per cent by a daily supplement of approximately 150 units there were increases of 17 to 25 per cent in the daily food consumption with correlated slight increases in the gain in weight of the children. Since the higher vitamin B intakes produced no ill effects and did stabilize appetite they might be regarded as optimum.

Urea and Alveolar Carbon Dioxide.—In a human subject ingestion of 30 to 40 grammes of urea caused a marked rise in the alveolar carbon dioxide for two to two and a half hours and a significant rise in the respiratory quotient in the period from one to three hours after ingestion both changes being related to the alkalosis caused by the ingestion of urea. There was no effect on the total metabolism. Water produced a slight fall in the alveolar carbon dioxide but no change in the respiratory quotient.

Radiology of Region of Lacrimal Sac with Observations on Technique of Endonasal Sac Operation.—H. Brunner
Glaucoma Arteriale of Cornea.—G. Favaloro

Tay Sachs's Disease.—This is a review of the pathological findings reported in the literature on Tay Sachs's disease. The histological findings in four additional cases showing typical appearances are described.

Rosacea Iritis.—Attention is drawn to the fact that iritis may occur in acne rosacea without corneal involvement. An endogenous route is assumed.

Glaucoma Anteritis of Continuo—This condition is described as a form of glaucoma which typically is subacute and stimulates haemorrhagic glaucoma. It is generally unilateral and always ends in blindness. The characteristic features are new vessel formations on the iris of arterial or venous origin, a marked tendency to bleeding at operations, and a deepening of the anterior chamber. Pathologically it is probably a lesion of the vessels in the anterior segment of the eye.

Anaemia Gravis with Enlargement of Spleen—M J Cathala and P Morel
*Sudden Death in an Infant with Eczema—M R A Marquezy and Mlle Ladet

Sudden Death—Necropsy on this case revealed much hyperaemia of the viscera with marked hypertrophy of the lymphoid tissue of the abdomen. The central nervous system showed diffuse vasodilatation and oedema in the region of the third ventricle. The authors consider that these changes are explained by damage to the autonomic nervous system and that injury to the temperature regulating centre in the neighbourhood of the third ventricle explains the vascular changes and oedema of the viscera. The sudden death seemed to be due to secondary changes, such as hyperpyrexia and vascular collapse.

Short Evipan Anaesthesia for Delivery in Normal Parturition—H Roemer
*Investigations into Mode of Action of Short acting Narcotics I Comparison by Animal Experiment of Effectiveness of Evipan and Eunarcon H Localization of Lesions responsible for Side effects—Violet Heinz Werner

Short acting Narcotics—In a series of animal experiments the author has compared the actions of evipan and eunarcon, and of the original barbiturates from which these anaesthetics were developed. The average fatal dose for mice of evipan is higher than that of eunarcon while the rate of elimination of the former in rabbits is also considerably greater. The increased effectiveness of eunarcon is probably due to its halogen substitution. During the prolonged administrations of these experiments side effects, such as spasms tremors increased reflexes etc appeared. Histological examination of the brain in such animals showed damage to ganglion cells. Similar cell damage has been reported in the human brain.

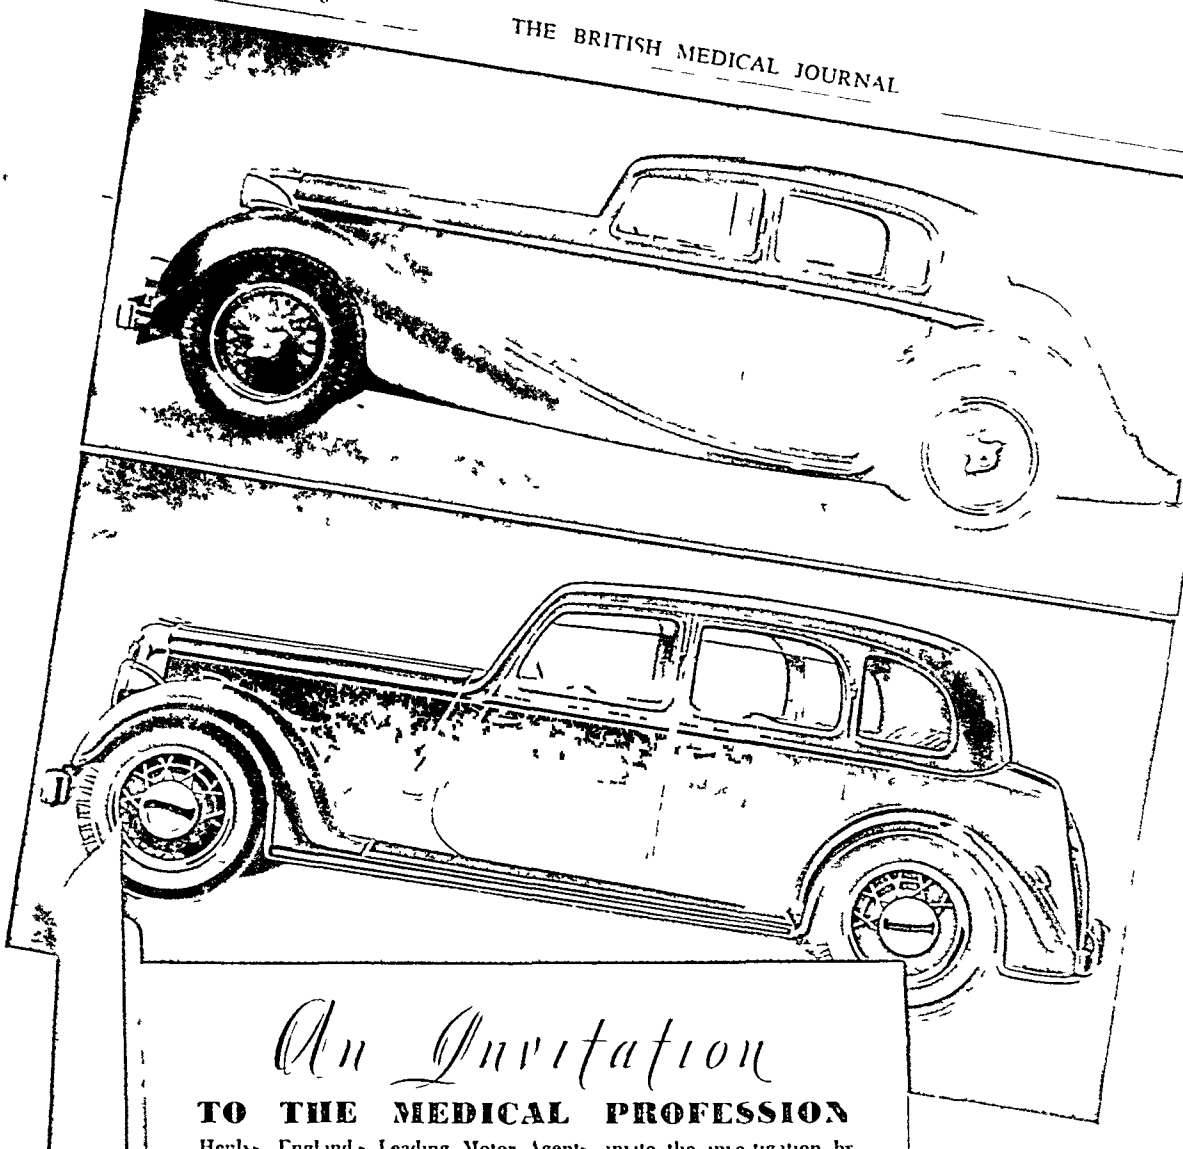
Chylous Filarial Lymphatic Varix Clinical and Pathological Report—F W O'Connor and J Knott

Placenta in Malaria—The characteristic placental response to malaria was only seen with *P falciparum* infections. It did not occur immediately at the beginning of a new attack but immediately at the beginning of a relapse. Schizonts and reticulo endothelial phagocytosis were not seen before the fourth month of pregnancy. All stages between large lymphocytes and mature reticulo endothelial cells were seen in the intervillous spaces. Relapses following parturition are probably due to expulsion with the placenta of a highly active reticulo endothelial system of defence. No evidence of congenital malaria was discovered.

Pigments in Blackwater Fever—Pseudo methaemoglobin with an absorption band between those of sulph and met haemoglobin has been confirmed as the new pigment in the serum of cases of blackwater fever in Greece, methaemoglobin was not found in the serum. The magnitude and suddenness of the haemolysis is not the only factor determining the concentration of pseudo methaemoglobin, nor does it directly determine the degree of anuria. Methaemoglobin occurs in the urine at a *pH* of from 5 to 9 is formed before the urine reaches the bladder, and is not directly related to the pseudo methaemoglobin in the blood. urines not containing methaemoglobin do not develop it at laboratory temperature.



Typhus Immunization—Monkeys and humans treated with formolized tissue cultures of typhus rickettsia develop a positive Weil-Felix reaction. Monkeys given 2 c.cm. of the vaccine in three increasing injections at three day intervals were immune to a large infective dose of virus two weeks later.

Biological Peculiarity of Locomotor Apparatus—E Heidsieck
Humerus Varus with Special Reference to Shoulder Contracture—E Fröhlich
Genuine or Teratological Congenital Dislocation of Hip—H Korein
*New Investigations regarding Pathology of Acetabular Fossa—H Gickler and S Teufel
A Present day Foot Artist—W Thomsen

Acetabulum—Investigations were undertaken to determine the influence of the position of the acetabular fossa on its configuration. These investigations were carried out on plaster cast models of the hip allowing the femoral head to exert pressure in different directions. The authors have also evolved a new technique of taking x ray films of the acetabular fossa and have investigated cases of separated epiphysis of the femur and also cases of congenital dislocation of the hip. They reach the conclusion that in separation of the femoral epiphysis the chief aetiological factor is to be found in a more anteriorly placed acetabular fossa. In congenital dislocation of the hip the acetabular fossa remains in its foetal position.

An Invitation

TO THE MEDICAL PROFESSION

Henlys England's Leading Motor Agents invite the investigation by medical men of the many outstanding advantages to be gained by going to Henlys for new or used cars

If you prefer a new car Henlys are distributors for SS Jaguar Rover Alvis Austin and Studebaker and agents for other outstanding productions, including Morris Riley Daimler Humber Hillman Armstrong etc

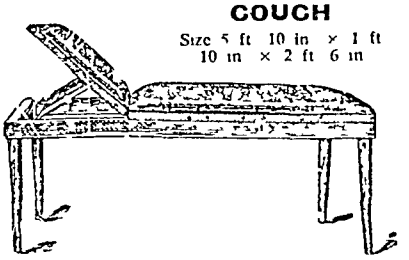
Easy, Economical, Effective Short-wave Diathermy with INDUCTOTHERMY



For the treatment of arthritis, neuritis, pelvic inflammations, sprains or any of the many chronic disorders in which HEAT is indicated, it will pay you to investigate Inductothermy For here is a method that develops more heat at greater depth than older agents and is, moreover, free from intricacy of control or application

Patients like the Inductotherm for its quietness, for the absence of complicated preparation, for the soothing warmth that is induced without the discomfort of other methods Users like it for its effectiveness, because Inductothermy selectively generates MORE heat in LESS time, WHERE IT IS MOST USEFUL—in the vascular tissues

Why consider ordinary short-wave equipment when the Inductotherm costs so little? Full particulars of and references validating every claim for Inductothermy are given in a series of interesting booklets Your request for free publication group AV1, will not obligate you in any way

INCORPORATING THE RUSS INSTITUTE

POSTS OVERSEAS FOR MEDICAL MEN

A register is kept in the School of medical men who are prepared to be considered for posts overseas and the School is frequently asked to advise plantation and mining companies when such posts fall vacant

The salaries offered are attractive conditions of service are governed by standardised forms of contract and many of the posts offer to medical men a most interesting field in which to practise their profession

It is desirable that candidates for posts overseas should hold a diploma in tropical medicine and hygiene The course provided by the London School for the Conjoint Board's Diploma lasts six months and the tuition fee is £40 The course may be taken from October to March or from January to June There are generally more vacancies in the course commencing in January

The Director of the Ross Institute is always glad to interview medical men who would like information regarding the possibilities of a career overseas if they will be good enough to make an appointment to call on him Enquiries may be addressed to

LONDON HOSPITAL MEDICAL COLLEGE & DENTAL SCHOOL

THE WINTER SESSION will Open on Monday October 3rd

The LONDON HOSPITAL serves the East End of London and with eight hundred and ninety beds is the largest voluntary Hospital in England. The Out-patient Department which deals with about three hundred new patients per week is extensively used for teaching.

The Medical School has a large number of resident medical officers. Every year twenty resident house physicians and house surgeons and eighty students' dressers and clinical assistants are appointed from the recently qualified students. The opportunities which these appointments offer for obtaining clinical experience in hospital practice are unrivalled.

The MEDICAL COLLEGE is attached to the Hospital and includes Departments of Anatomy, Physiology, Bacteriology, Chemical Pathology, Applied Anatomy and Medicine of the University of London.

SPECIAL COURSES in Anatomy and Physiology for the Primary F.R.C.S. and Advanced Courses in Surgery for the Final F.R.C.S. Examination and in Medicine for the M.D. and M.R.C.P. Examinations are held twice a year.

ENTRANCE SCHOLARSHIPS AND PRIZES of the total value of £1,000 are awarded annually. Research Funds to the value of £13,000 permit of a number of research workers being engaged in medical research.

The MEDICAL COLLEGE contains a modern Museum of Pathology and a Library provided with all the current medical periodicals in charge of a full-time Librarian. There is an Athletic Club and Dining Hall, a Cricket and two Squash Courts in the Students' Hostel. The Athletic Ground of 18 acres at Hale End is within easy reach of the Hospital.

The HOSPITAL is only 20 minutes from Charing Cross and Baker Street Stations. Rooms for those who wish to be in residence in proximity to the Hospital can be obtained in the Students' Hostel.

Further details may be obtained from the Dean, Dr. A. E. Clark-Kennedy, M.D., F.R.C.P., Physician to the Hospital and Fellow of Corpus Christi College, Cambridge, who will always be pleased to meet students wishing to see the Hospital and College and to whom applications for rooms should be made, Turner Street, London, E.1.

THE CLINICAL RESEARCH ASSOCIATION, LTD.

WATERGATE HOUSE, ADELPHI, W.C.2 (Close to Charing Cross Station)

Appointments for Medical Officers in the ROYAL AIR FORCE

Medical men are invited to apply for Short Service Commissions in the Royal Air Force Candidates must be registered under the Medical Acts and be not more than 31 years of age on entry

The period of service is 3 years—extendible to 5 years A gratuity of £400 or £1 000 is payable at the termination of 3 or 5 years respectively Permanent commissions are awarded in a number of cases These offer a pensionable career with the opportunity of extra leave on full pay for specialised study Applicants who hold—or are likely to hold—post graduate appointments in civil hospitals may on joining the Royal Air Force be seconded until the termination of their appointments (for a period not exceeding one year) An interval of commission up to twelve months is allowed for appointments held at approved hospitals

Fuller information can be obtained from The Director of Medical Services, Air Ministry, Kingsway, London

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in September, 1938

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years, which if desired is usually extended to five years at the discretion of the Admiralty

At the end of three years' service, officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000

At the end of five years' Short Service, permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax)

Full opportunities exist for transfer to the permanent list, and periods of unemployed or half pay are very rare The assistance of private income is not necessary for the purpose of supplementing official pay and allowances

Opportunities are available for officers on the permanent list for post-graduate study, to specialise to take higher examinations and to obtain further qualifications

Naval Medical Officers are included in the Scheme for Marriage Allowance under the same conditions as for other Naval Officers

Copies of the regulations for entry and conditions of service, including rates of pay, allowances and retired pay may be obtained from the Medical Director General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than 31st August, 1938

UNION OF SOUTH AFRICA

VACANCY FOR

(A) SENIOR PROFESSIONAL OFFICER (PHYSIOLOGY)—ONE POST (Salary Scale £600—£750).

(B) SENIOR PROFESSIONAL OFFICER (BIOCHEMISTRY)—ONE POST (Salary Scale £600—£750).

Applications are invited from suitable candidates for appointment to the above-mentioned posts in the Department of Agriculture and Forestry in the Union of South Africa.

The appointees will be selected on a basis of qualifications and experience.

SPECIAL QUALIFICATIONS.

For the Physiology Professional Officer (Physiology).

Applicants must be in possession of a doctor's degree with thorough training in physiology and must have given special attention to this branch in their advanced studies. Experience in biochemical research work, especially in the direction of fruit research, will be a recommendation, although such qualification will not necessarily be regarded as essential.

For the Biochemistry Professional Officer (Biochemistry).

Applicants must be in possession of a doctor's degree with thorough training in biochemistry and must have given special attention to this branch in their advanced studies. Experience in biochemical research work, especially in the direction of fruit research, will be a recommendation, although such qualification will not necessarily be regarded as essential.

Certificates and testimonials should not be submitted in the first instance.

Before appointment to the fixed establishment in a permanent capacity the successful candidates will be required to serve on probation for a period of not less than twelve months; they must be British subjects and have resided in the Union of South Africa or in the Mandated Territory of South West Africa for not less than three years, and they must furnish satisfactory certificates of birth and health. Successful candidates who do not satisfy the nationality and residential qualifications will be appointed on contract until their services are satisfactory, they acquire liberty for permanent appointment. Proficiency in one of the official languages—English and Afrikaans (or Nederlands)—is an essential requirement.

Copies of publications and scientific reports of which the applicant is the author must be attached to all applications where possible.

Any degrees obtained by candidates must be those of universities of recognised standing. Any qualifications additional or of a standard equal to those which are required will also be taken into account.

Application must be made on the prescribed form (Z.S.C.) which is obtainable from the Secretary, Office of the High Commissioner for the Union of South Africa, South Africa House, Trafalgar Square, London, to whom all completed forms must be addressed.

Applications must reach the High Commissioner's office not later than September 14th, 1938.

LIVERPOOL COUNTY BOROUGH

LOCAL EDUCATION AUTHORITY

ASSISTANT SCHOOL MEDICAL OFFICER (WOMAN)

Full particulars on application.

The appointments are for six months from October 1st, 1938. There are six Resident Officers.

Application forms can be obtained from the Secretary, and must be returned not later than August 20th, 1938.

August 3rd, 1938.

WEST HAM HOSPITAL FOR NERVOUS AND MENTAL DISORDERS
Goodmayes, Ilford, Essex

Applications are invited for a male JUNIOR ASSISTANT MEDICAL OFFICER at the above Hospital. Candidates must be unmarried.

The commencing salary is at the rate of £350 per annum, rising by annual increments of £50 to a maximum of £400 per annum, together with emoluments in lieu of board, lodging and washing valued at £150 per annum. The person appointed will be paid in addition such salary, including £50 per annum on account of the Diploma of Psychological Medicine.

The appointment is subject to the provisions of the Asylum Officers' Superannuation Act, 1909. Class I. and to a satisfactory medical examination.

A knowledge of bacteriological work will be an advantage.

Applications, stating age and experience, accompanied by copies of three testimonials, must reach the Medical Superintendent not later than August 31st, 1938.

THE ROYAL EYE HOSPITAL
St. George's Circus, Southwark, S.E.1

SENIOR HOUSE SURGEON and TWO ASSISTANT HOUSE SURGEONS required at the above Hospital. The appointment is in the first instance for a period of six months, but board and residence as from October 1st.

Salaries: Senior House Surgeon, at the rate of £150 per annum. Assistant House Surgeons, £100 per annum. Candidates must be registered practitioners.

Applications, with copies of three recent testimonials, should be sent to the Secretary not later than Thursday, September 1st.

F E DALTON, Secretary.

THE SALVATION ARMY THE MOTHERS' HOSPITAL
Lower Clapton Road, Clapton, E.5

Applications are invited from Medical Women for the post of JUNIOR RESIDENT MEDICAL OFFICER, vacant October 1st, 1938. Salary £80 per annum, with board, residence and laundry. The appointment is for six months.

Applications with testimonials must be sent to the Secretary on or before Monday, August 29th, 1938.

FRED HAMMOND, Secretary.

Modern Iron Therapy

Iron Jelloids are an elegant and reliable means of administering the protocarbonate of iron. The preparation has none of the disadvantages of Pil Blaud. The iron content remains fresh and unoxidized indefinitely and injury to teeth is avoided.

The Jelloids are highly effective in the treatment of achlorhydric anæmia and indeed in all the simple anæmias in which massive iron therapy is indicated.

Iron Jelloids

You are cordially invited to apply for samples for clinical test

The Agency has made arrangements for special facilities, on very favourable terms, to be afforded to approved purchasers for the advance of part of the premium for any suitable practice or partnership. Full details on application.

Simplify the Technique of Infant Feeding by using

Allenburys Progressive System

ALLENBURYS SYSTEM EMBODIES THE FOLLOWING ADVANCES IN THE SCIENCE OF INFANT FEEDING

(1) **Humanised Casein lactalbumen ratio**
(2) **Intimate incorporation of Dextrin-Maltose**, the benign starch-free mixture of non fermenting carbohydrates
(3) **Homogenised Cream** in reconstituted Milk Foods
(4) **Prophylaxis of Scurvy** Every tin of Allenburys Foods bears and has borne in the past explicit instructions for daily administration of vitamin C
(5) **Prophylaxis of Rickets** Calcium Phosphorus ratio adjusted 560 units of vitamin D per quart reconstituted **Independent biological assay of antirachitic potency**
(6) **Prophylaxis of Anæmia** The reconstituted foods contain 4 parts per million of available iron

Allenburys System provides every known Nutritional Requirement of the Infant
It enables the physician to replace unreliable home-made milk mixtures with readily prepared infant foods which eliminate the risk of enteral infection and provide easily digested scientifically balanced meals for babies at every stage in their development

ALLENBURYS Humanised MILK FOOD No. 1 (Entirely Free from Starch)

The best first artificial food because it resembles breast milk closely in composition and in the ease with which it is digested

Composition when reconstituted by dilution (1 6) with water as instructed on tins

Fat	Casein	Lactalbumen	Lactose	Dextrin Maltose	Ca as CaO	P as P O	Fe parts per million	Vitamin D per fl oz not less than 14 units
3 1%	1%	0 7%	7 3%	3 3	0 09%	0 16	4	

This food is intended for use from birth to 3 months, or for longer periods in dyspeptic infants, who tolerate it readily

ALLENBURYS Humanised MILK FOOD No. 2 (Entirely Free from Starch)

Milk Food No 2 is prepared in exactly the same way as No 1 and retains its general features It is intended for use during the second trimester when digestion is established and it **contains a higher proportion of milk protein and correspondingly less carbohydrate** The mineral content is adequate in respect of calcium, phosphorus and iron and each fluid ounce of reconstituted food contains not less than 14 international units of vitamin D

ALLENBURYS MALTED FOOD No. 3 (The First Step to Weaning)

This food introduces partially converted starch at the seventh month It has a mineral and vitamin content equal to No 1 and No 2 and it is intended for use in conjunction with the broader dietary now recommended for the second six months of infancy

Malted Food No 3 prepared for use with cows milk and water has this composition

Protein	Fat	Carbohydrate	Ca as CaO	P as P O	Fe parts per million	Vitamin D per fl oz not less than 14 units
2 8%	2 2%	9 7%	0 14%	0 13%	4

ELASTIC PLASTER BANDAGES

for chronic ulceration of the leg, and other conditions

Chronic ulceration of the leg can be most successfully treated with SALTAIR ELASTIC PLASTER BANDAGES Made from a specially woven selvedge material, uniformly impregnated with an antiseptic zinc oxide paste The bandages are self-adhesive and highly elastic, so that they provide an even surface dressing that will not crease or slip An attractive characteristic of this ambulatory treatment is that it allows of full activity of the limbs SALTAIR ELASTIC PLASTER BANDAGES can also be used for abdominal support after operation, as a strapping for breast in mastitis, or as a dressing for minor injuries, boils, etc

SAUNDERS' BOOKS

ALL NEW and of REAL HELP in PRACTICE

PRACTICE OF UROLOGY

By LLOYD HERMAN PS MD Professor of Urology University of Pennsylvania Graduate School of Medicine Octavo of 925 pages with 756 Illustrations on 504 Figures Cloth **45s** net

In Dr Herman's book we can apply as few text books do most those facts about urinary affections which the medical adviser of a patient should be possessed The subject matter is skilfully arranged and the text is well illustrated
—THE LANCET

SURGICAL DISEASES OF MOUTH AND JAWS

By EMIL CALVIN PADGETT PS MD FACS Associate Professor of Clinical Surgery University of Kansas Octavo of 807 pages 354 Illustrations Cloth **45s** net

We have nothing but praise for this work as a whole It is easily read the type being clear and the text divided into well indicated sections but hundreds and photographs amply illustrate it This is a valuable work
—BRITISH MEDICAL JOURNAL

TEXTBOOK OF OPHTHALMOLOGY

By SANFORD R GIFFORD MA MD FACS Professor of Ophthalmology Northwestern University Medical School 492 pages 249 Illustrations 11 in Colours Cloth **18s** net

This textbook gives an admirable survey of the essentials of ophthalmology for the student and practitioner Its descriptive matter is concise and easy to read —THE LANCET

THE CEREBROSPINAL FLUID

By H HOUSTON MERRITT MD and FRANK FREMONT SMITH MD of Harvard With Foreword by JAMES B AYER MD Octavo 353 pages Illustrated Cloth **22s 6d** net

The book has practical value as a clear statement of the changes in the fluid which may be expected in every form of disease in which it is affected —THE LANCET

THE BUSINESS SIDE OF MEDICAL PRACTICE

By THEODORE WIPRUD Executive Secretary of the Medical Society of Milwaukee County Lecturer in Medical Economics at Marquette University 177 pages Cloth **12s** net

We have rarely read a book that is so compact a volume such a compendium of valuable information What is more - know of no other book written in English that even approaches Mr Wiprud's book in usefulness
—SOUTH AFRICAN MEDICAL JOURNAL

TEXTBOOK OF MEDICINE

Edited by RUSSELL L CECIL MD Professor of Clinical Medicine Cornell University Octavo 1614 pages Illustrated New (4th) Edition Cloth, **40s** net

This book should make a strong appeal not only to the practitioner who wants a reference volume to cover the whole realm of medicine but also to the student who will find in it all that he requires for his pass examinations and also for higher degrees —MEDICAL PRESS AND CIRCULAR

THE LARYNX AND ITS DISEASES

By CHEVALIER JACKSON MD ScD LLD FACS and CHEVALIER L JACKSON AB MD, MSc (Med) FACS 555 pages 221 Illustrations 11 Plates in Colour Cloth **35s** net

From the accepted masters of bronchoscopy and oesophagoscopy one expects a really interesting book on the larynx nor are we disappointed The book is in every sense complete it deals with everyday laryngeal troubles and at great length with all the rarer conditions —IRISH JOURNAL OF MEDICAL SCIENCE

W B SAUNDERS COMPANY, Ltd, 7, Grape Street, London, W.C 2

THROMBIN-COAGULANT-MAW DRESSINGS HAVE PROVED THEIR EFFICIENCY!

In the short time they have been on the market Maw's T C M Dressings have achieved remarkable success Members of the profession who have used them have been impressed by the rapidity with which coagulation is achieved and numerous instances are recorded of severe haemorrhage being checked almost instantly T C M Dressings are treated with Thrombin-Coagulant-Maw, a preparation of natural Thrombin which accelerates blood coagulation and causes clotting within 5-15 seconds They are supplied sterile in sealed drums ready for immediate use and the series consists of Gauze Lint Squares suitable for most purposes Special T C M Dressings can be supplied when required

They cost only a trifle more than ordinary Dressings and are well worth the extra charge We ask you to give them a fair trial, for we are confident that you will be satisfied with the results

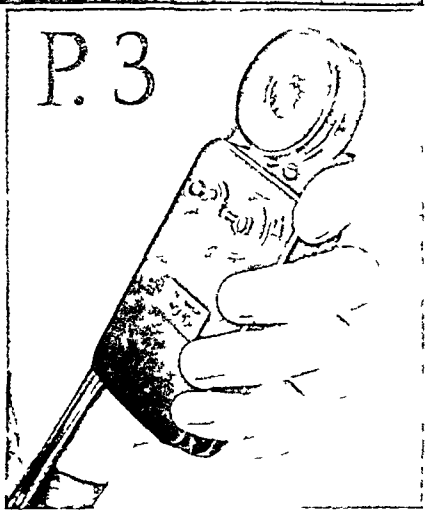
The Hearing Aid Par Excellence

BŌNOCHORD



Vest Pocket Valve Amplifier

SMALL AS A MICROTELEPHONE YET WITH THE HIGHEST OUTPUT EVER OBTAINED FROM A POCKET VALVE DEAF AID

Since their introduction the main obstacle to the general use of valve amplified deaf aids has been their bulk and weight. Attempts have been made to produce them in a form suitable for wear on the person without inconvenience but in every case performance has been sacrificed to size, or the instrument has been unsightly for pocket use.

The BONOCHORD P3 is a 3 valve amplifier with *piezo* electric microphone which will fit *easily* into a waistcoat pocket with separate batteries. Special valves designed for us have made this possible together with the use of small components developed by our Research Department. In spite of its small size the aid has the amazingly high maximum output of 60 decibels. Let us send you full details of this new instrument which we believe will do much to establish the general use of valve aids.

Supplied by Special Warrant to H.M. the King and H.R.H. the Crown Prince of Sweden and also to H.M. the King of Denmark

RAMLÖSA

50 YEARS' REPUTATION FOR MEDICINAL AND TABLE USE

This famous natural mineral water is bottled at the source and slightly aerated with pure Carbonic Acid The characteristics of "Ramlosa" are a relatively high Sodium Carbonate content in combination with an uncommonly low content of Calcium and Magnesium Salts (practically no lime) and a virtually complete absence of iron "Ramlosa," in consequence, avoids the fault of certain natural mineral waters which upset the digestion by partially neutralising the hydrochloric acid in the gastric juice "Ramlosa" considerably increases the amount of urine and is therefore indicated in the treatment of diabetes, gout, kidney troubles and other metabolic disorders, as well as in rheumatism and in conditions where a large supply of fluid is of importance as a mild form of initial physical therapy

'AMYTAL'

BRAND

Iso-amyl Ethyl Barbituric Acid

FOR SEDATION AND HYPNOSIS

The tranquil sleep of children is always the envy of less fortunate adults to whom at times this boon is denied because of sickness or other conditions which upset the psychic or emotional equilibrium

'Amytal' supplies the relaxation and sleep which are essential to recuperation of vital forces It may be prescribed wherever there is need to combat insomnia, restlessness, or apprehension A noteworthy margin of safety is characteristic of 'Amytal' and since destruction of the hypnotic within the body appears to be accomplished rapidly there is little tendency to unwelcome side-reactions or after depression

'Amytal' is supplied in ½-gram, ¼-gram, and 1½ gr in tablets in bottles of 40 and 500

ALASIL

Better Salicylate Therapy

WHATEVER be the season of the year there is a wide sphere of utility for Alasil the improved form of salicylate medication

Alasil is a very definite advance on ordinary compounds of salicylic or acetyl salicylic acid both in therapeutic efficiency and in freedom from the risk of unpleasant gastro intestinal sequelae This high tolerability is due to the fact that Alasil is composed of calcium cetyl salicylate—the least irritating of the salicylate compounds—and Alocol (Colloidal Hydroxide of Aluminium) a powerful gastric sedative and antacid

A careful series of experimental tests has shown that Alasil is more completely absorbed than ordinary salicylate compounds and that it is practically free from the risk of liberating free salicylic acid in the stomach

Wide clinical experience anticipated these findings by demonstrating that Alasil can be pushed or prolonged to a much greater extent than ordinary salicylate compounds and that it can be given with safety to children adults the aged and patients with finely balanced digestive capacities An analgesic antipyretic and sedative of established value

A supply for clinical trial with full descriptive literature sent free on request

A major operation in progress in the operating theatre of a London Hospital

DEGREES OF PROTECTION....

THE most elaborate precautions against every possible chance of germ infection are of course essential in the operating theatre It would be ridiculous, however, to expect anything approaching this meticulous attention to antiseptic cleanliness in everyday hygiene and in the home treatment of superficial wounds

The general public is nevertheless beginning to realise the importance of germ-free cleanliness Hygienic standards to-day are higher than they have ever been It is generally agreed by medical men that although regular use of antiseptics is not desirable or really necessary for ordinary toilet purposes, the use of a reliable antiseptic soap can play a very valuable part in the prevention of infectious disease Face and hands are continually exposed to infectious germs, and require washing with Wright's Coal Tar Soap

Wright's has substantial antiseptic and antipruritic qualities For over 70 years it has enjoyed the confidence of the medical profession, and to-day more doctors use Wright's than any other brand of toilet soap Wright's Coal Tar Soap is prepared from materials selected after stringent tests It is the only soap in the world to contain 'liquor carbonis detergens' (Wright's), the valuable dermatological therapeutic recommended by skin specialists the world over In surgeries, hospitals, nursing homes and private households Wright's meets all the requirements of modern everyday hygiene You can use it and recommend it to your patients with complete confidence

INDICATIONS FOR 'SANATOGEN' No 9

ENERGY

"Monotony more exhausting than hard work."

That only 30 men in every hundred like their work was quoted recently by the "Daily Express" as the findings of a questionnaire addressed to 500 University graduates Hence monotony, with the tiredness and nerve exhaustion that monotony induces Conversely, a distinguished physiologist reminds us that "those who find real pleasure in their work are able to work extremely hard at it without any harm accruing' Unfortunately not many of us can choose our occupations, and even fewer can change them when they no longer interest us We get caught in a vicious circle, the nervous exhaustion interfering with digestion, absorption and nutrition generally The malnutrition in turn exacerbates the nervous disturbance

In such circumstances 'SANATOGEN' has been found of great value It is a carbohydrate-free mixture of 95 per cent pure milk casein with 5 per cent sodium glycerophosphate 'SANATOGEN' is readily digested and absorbed, leaving no appreciable residue It supplies in concentrated form two of the essential materials needed for the repair of tissues and for the nourishment of nerve cells In addition to being readily assimilable, it stimulates appetite and promotes the digestion and utilisation of other foods taken with or after it

I am a firm believer in the efficacy of 'Sanatogen for the relief of nervous exhaustion and debility The types of cases in which I use it are overwork especially mental work, fatigue insomnia, and loss of appetite, weight and general tone I find that combined with an ordinary tonic a large teaspoonful in hot milk at bedtime is most beneficial I have noticed that the addition of 'Sanatogen to the daily menu means that the patient gets more good out of his food I put it down to increased efficiency of the visceral nervous system It is now almost 25 years in my H S days since I saw marked improvement from the use of 'Sanatogen —M B , B Ch

'I had been feeling very tired, owing to overwork in a busy general practice and I can definitely say that while taking 'Sanatogen I felt more energetic and experienced a euphoria which had hitherto been missing —M B , B Ch

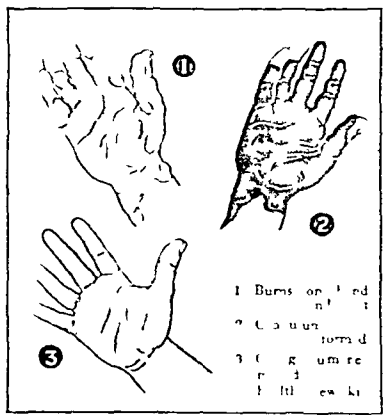
'SANATOGEN'

(Trade Mark)

A brand of Casein and Sodium Glycerophosphate

Sold by all chemists price 2/6 to 19/9

DOSAGE For children and adults two teaspoonsful three times daily or according to circumstances For infants ½ teaspoonful added to each bottle feed



The word SANATOGEN is the Trade Mark of Genatosan Ltd and denotes the famous brand of Glycerophosphate manufactured by GENATOSAN Ltd Loughborough Leicestershire

Clinical samples and literature available on request to

GENATOSAN LTD., LOUGHBOROUGH, LEICESTERSHIRE

Tannic Acid

a recognised treatment for burns, scalds and abrasions

TRADE MARK 'TANNAFAX' BRAND

TANNIC ACID JELLY

(Tannic Acid with 0·5 per cent Phenol in a water soluble base)

Always ready for immediate application to the affected surface, 'TANNAFAX' eliminates the hazard of delay in treatment. Unscrew the cap from the tube and 'TANNAFAX' is ready for use. Owing to its freedom from oil and grease 'TANNAFAX' is of particular value when repeated dressings are required. Its removal may be effected without giving rise to the pain associated with oily preparations.

Tube of 20 gm. (3·4 oz. approx.) 8d. each
Tube of 4 oz. (113 gm. approx.) 2/1 each

ADEXOLIN LIQUID AND CAPSULES

Standardized concentrates of vitamins A and D. One capsule recommended daily as a general protective tonic and nutritional barrier to casual infections. In pregnancy one daily for the last 100 days. For infants 2 drops in every bottle feed. Each 3m. capsule equivalent to 10 cc. and each cc. of liquid equivalent to 20 cc. of medicinal cod liver oil. *Capsules* Boxes of 25 2/6, 100 7/6, 300 20/6, 1000 56/. *Liquid* 3 oz. phials 2/6, 2 oz. bottles 7/6, 4 oz. 12/6, 8 oz. 22/6.

SYRUP MINADEX

The reconstructive tri-mineral tonic containing the active principles of Syr. Ferri Iodidi Co. and vitamins A and D incorporated as concentrates free from oil (18,000 and 3,000 international units per fl. oz. respectively). Restores appetite and tone to debilitated patient particularly those convalescent after acute illness. Combats anaemia, raises resistance to infection. Children thoroughly enjoy it for its appetising flavour. 4 oz. bottle 2/6, 12 oz. 4/6, 80 oz. winchesters 22/6.

DISSOLVED VACCINES G.L.

The high standard and rapidity of the effects produced by Dissolved Vaccines G.L. are due to two factors. *First* that the organisms being in solution can stimulate the antigenic response immediately upon injection. *Second* that being detoxicated the vaccines can be given in sufficient and substantial dosage without provoking undesirable reaction. In 5 cc. rubber-capped bottle 7/6, 10 cc. 10/9, 20 cc. 17/6. (Whooping Cough Dissolved Vaccine G.L., 5 cc. bottles 10/9, 10 cc. 18/6, 25 cc. 25/.)

FERSOLATE TABLETS

(FERROUS SULPHATE G.L.)

For all iron deficiency anaemias. Convenient highly effective inexpensive. Each 3 gr. tablet contains desiccated ferrous sulphate yielding exactly 1 gr. ferrous iron the most effective agent for treatment and is therapeutically equivalent to 15 grs. Blaud's Pill B.P. Dosage can therefore be achieved in minimum bulk. Bottles of 100 2/6, tins of 500, 7/6, 1000 12/6.

The above prices are subject to usual professional discount but do not apply in Eire.

THE SIGN OF A GL PRODUCT

GL Products for Everyday Practice

OTHER G.L. PRODUCTS OF SPECIAL INTEREST. Ostocalcium Tablets (calcium sodium lactate and calcium phosphate with vitamin D). Colloidal Calcium with Ostelin (the first preparation of vitamin D for parenteral use). Ostomalt (the four vitamin Malt Extract). Examen (Parenteral Liver Extract). Glucose D. Farex (Reinforced 3 Cereal Food).

affected joints And here I would stress the urgent necessity for the provision of institutional treatment for cases of rheumatoid arthritis on the same lines as is done for tuberculosis Were it a lethal disease this would have been done long ago, but since it is merely intensely disabling and crippling little has been done about it The prolonged treatment required, both general and local, can seldom be effected in a domiciliary way except for the very well-to-do For the poorer classes treatment is all too frequently spasmodic, disjointed, and unsustained, with the inevitable result of permanent disablement Rest, fresh air, warmth and sunlight, generous feeding, treatment to the joints by physical methods—dry or moist heat, massage passive movements, splinting when necessary diathermy x rays, orthopaedic measures—together with specific drug treatment, as by vaccine or by gold therapy where can all these be effectively combined other than in institutions well equipped and staffed for the purpose? Much of our disappointment in results is due to lack of facilities for concerted, concentrated, and continued treatment Professor Stanley Davidson at the Bath Conference on Rheumatic Diseases in April last forcibly stressed this aspect of the subject, maintaining that the voluntary hospitals under present conditions are quite inadequate to provide the necessary facilities for dealing with the large numbers of sufferers from the rheumatic diseases, and that municipal or State aid is required for the provision of centres for early investigation and prolonged treatment The creation of rheumatic centres in various parts of the country, though belated, is a beginning of what must ultimately develop on a greatly extended scale if the rheumatic scourge is to be effectively combated

VACCINES

The advocates of vaccine therapy in the treatment of rheumatoid arthritis, "primary" and "secondary," presumably accept unreservedly the infective theory of causation, otherwise the rationale of their treatment falls to the ground The uncertainty as to the specific organism involved—beyond the general incrimination of the streptococcal group—casts doubt on the specificity of vaccine treatment Multiple vaccines on the hit-or-miss principle are clearly unscientific, and any therapeutic benefit from them must result from general rather than specific stimulation of reaction against infection My criticism of the published results of vaccine treatment in rheumatoid arthritis is that they are not subject to adequate control—first in diagnosis, and, secondly, by comparison with parallel cases untreated by vaccines In secondary rheumatoid arthritis of proved infective origin, if the focus of infection has been removed, vaccines are usually unnecessary recovery will take place without their aid In primary rheumatoid arthritis where no infection is demonstrated vaccine treatment rests on no firm foundation, and is hypothetical in theory and disappointing in practice (Okell, 1937) I have seen too many cases of rheumatoid arthritis treated by prolonged vaccine therapy alone to the exclusion of other measures, gradually drift into a helpless and hopeless condition when other means might have been usefully employed, to leave me in any doubt

My considered opinion is that vaccine therapy has been frankly disappointing, and on inquiry from various workers in centres where adequate investigation and control of cases is undertaken, I find that vaccine therapy is being used less and less in some centres it has been given up entirely I suggest this as a fruitful topic for your discussion

PHYSICAL TREATMENT

Perhaps the greatest advance in the physical treatment of rheumatoid arthritis has been the recognition of the importance and value of rest to the affected joints This is obtained by temporary fixation in plaster, supplemented after a period of complete rest by daily passive movements of the joint through its normal range By this means rest is assured to the inflamed joint, contractures into faulty positions are prevented, and subsequent deformity or disability is avoided The more care taken in the early stages to prevent fixation in faulty positions, the less the need for drastic orthopaedic measures in the later stage Active collaboration between physician and orthopaedic surgeon should take place throughout prevention is better than cure (Kindersley *et al* 1936)

CHRYSOTHERAPY

Reference to chrysotherapy in the B M A report is limited to a single sentence "Gold preparations given by intramuscular injection have been used abroad for the treatment of arthritis, but beneficial results have not been confirmed" Since then much progress has been made In my experience gold therapy represents the greatest advance in the drug treatment of arthritis made during the last thirty years The almost dramatic results that are achieved in a relatively short space of time in selected cases are little short of marvellous From no other form of treatment in former years have I seen such gratifying improvement even in advanced and seemingly hopeless cases Careful choice of cases, however, should be made The tendency is to use gold indiscriminately in all rheumatic affections and thereby to bring discredit on the method Practically all observers are agreed that it is of no value in true osteo-arthritis and in non-articular rheumatic diseases its use should be limited to primary and secondary rheumatoid arthritis—in short, to the presumably infective forms The risks of untoward complications involved are not inconsiderable, but they are minimized by the use of a smaller dosage than was initially thought necessary, by careful test for idiosyncrasy to the drug and by a preliminary blood count and sedimentation rate before embarking on a course, and by the instant withdrawal on the first symptoms of intolerance The results achieved by gold therapy are well worth the risks that may be run Hartfall, Garland, and Goldie (1937) have done the most extensive work on gold treatment in this country They have published a review of 900 cases, giving the clinical analyses and results in 750 cases of rheumatoid arthritis and in 150 cases of other forms of arthritis, with the toxic reactions that occurred in the whole series Your collective experience of gold treatment would be instructive

SPA TREATMENT

In answer to the question, Is spa treatment helpful in the management of rheumatoid arthritis? the reply is undoubtedly, Yes It should be premised that there is nothing specific in the waters of the spas in this or any other country as a cure for rheumatoid arthritis The advantages of spa treatment are the removal from home surroundings to a new and healthy environment and the psychological element of hope, the availability at any well-equipped spa of a wide range of physical treatments, hydrological and balneological, access to medical advice from practitioners of special knowledge from long experience of the disease, facilities for thorough investigation, bacteriological and biochemical, necessary for diagnosis and control of treatment, and the use of natural mineral

waters for the correction of metabolic derangements and the improvement of general health so necessary a part of a concerted attack on the disease

The disadvantages are the expense entailed in a spa cure which must necessarily be prolonged if good results are to be achieved In so chronic a disease swift improvement cannot be effected in a short space of time Nevertheless even in a limited period a start may be made and a patient be put on the high road to recovery which may be followed up at home

A Dubois (*These Paris* 1938 No 140) states that there are numerous cases on record indicating the possibility of tumours developing after trauma In the absence of any knowledge as to the mechanism of the formation of new growths it is impossible either to affirm or to deny the relation of cause and effect between the trauma and the tumour Experimental work does not yet appear to have provided sufficient data to prove or disprove this connexion Most discussion has taken place about the development of tumours after a single trauma whereas the possibility of the formation of new growths after repeated injuries is readily granted There are numerous cases on record of the occurrence of sarcoma after injury to bone or muscle and a large number of cases have been reported in which tumours of the lung stomach intestine or kidney have developed after a trauma and in which the most reliable methods of investigation—such as radiography or surgical operation—have shown the absence of any tumour before the trauma Tumours of the testis or brain are remarkably frequent after trauma Numerous cases are also on record in which aggravation of the tumour following trauma is shown by increase in its size and the formation of metastases accompanied by deterioration of the general condition In order to affirm that a tumour is of traumatic origin a number of conditions must be present—namely a latent period varying with the nature of the tumour identity of the site of the trauma and of the tumour absence of any tumour before the trauma and histological confirmation of the presence of the new growth

ORTHOPAEDICS IN RHEUMATOID ARTHRITIS*

BY

NORMAN CAPENER, F R C S

Orthopaedic Surgeon Princess Elizabeth Orthopaedic Hospital Exeter and Mount Gold Orthopaedic Hospital Plymouth Consultant Orthopaedic Surgeon Royal Devon and Exeter Hospital Exeter

As a simple orthopaedic surgeon I feel very diffident in contributing to the opening discussion on this subject which has such wide general medical aspects Dr Edgecombe however in his excellent exposition has prepared the ground very well for me He has drawn attention to the need for special centres for the treatment of this crippling disease It is not generally realized however that the orthopaedic hospitals of the country are being asked to do an increasing amount of work in this field This is for example true of the orthopaedic hospitals of Devon where it has been found that the facilities we have for the treatment of uberculosis of joints infantile paralysis and fractures are applicable to the prolonged general and local treatment that Dr Edgecombe has stressed

To take bone and joint tuberculosis as an example we have to deal with much else besides the purely orthopaedic problems of immobilization and surgery Opportunities are provided for the more important general treatment of the disease combined with facilities for physical treatment and with occupational and educational interests These facilities render an orthopaedic hospital almost an ideal centre for the treatment of rheumatoid arthritis

In orthopaedics our great concerns are to preserve as well as to restore function to prevent just as much as to correct deformity In rheumatoid arthritis as to a large extent in bone and joint tuberculosis we stress from the outset of the disease the importance of the natural recuperative powers of the body if placed under proper conditions—namely, the protection from painful stimuli the utilization of the beneficial effects of sunlight fresh air, warmth cleanliness discipline and what is well called physiological rest

Physiological Rest

This involves immobilization of an affected joint in the best physiological position for the relief of pain for the arrest of the inflammatory process for rest to overactive muscles and the retardation of muscle atrophy The position should be the best for function should ankylosis occur This immobilization is combined with periodic movement and with other measures to improve joint and muscle function of a type and quantity suitable for the particular state of the disease In the active stage the amount of the permitted movement and physical therapy may be *nil* and may remain so for two weeks or more After the acute stage has subsided function is graduated according to the progress of the individual joint While affected joints are being rested those unaffected are given greater opportunities and encouragement for movement

Having generalized in this manner I feel that I should proceed with a detailed statement of what are these optimum positions for physiological rest Before doing

* Read in opening a discussion at a joint meeting of the Sections of Orthopaedics and Fractures and Physical Medicine and Physical Education at the Annual Meeting of the British Medical Association Plymouth 1938

this there is, of course, no need for me to stress that a very careful physical examination of the whole locomotor system is necessary From all points of view it is of importance that a detailed report of this examination be made

Physical Examination

It is the practice of orthopaedic surgeons in dealing with anterior poliomyelitis to make a muscle chart before starting treatment In such a chart the more important muscles of the body are listed and graded in such a way that the records can be used for comparative purposes by independent examiners throughout the course of the case

In my view we should make a similar record in rheumatoid arthritis I append a suggested scheme (Chart 1) for recording activity of disease, joint positions, ranges of movement, and so forth for the lower extremity

CHART 1

RECORD CHART FOR AN ARTHRITIC CASE

Date of Examination — Right side in black, Left side in red

Joint	Pain and Swelling	Deformity*	Movement	Range of Passive Movement*	Range of Active Movement* Against Gravity	Range of Active Movement* Gravity Removed	Remarks (eg, activity muscle wasting etc)
Hip	*S 0*	*30*	Flexion	(90−30)=60	60°	90°	*Not active*
			Extension	0			
			Abduction	0			
	P 1	*20°*	Adduction	(30−20)=10	20°	10	
		10°	Int rotation	(30−10)=10°	0	10°	
			Ext rotation	0			
Knee	*S 2*	*45*	Flexion	60−10=20	10	10°	*Extremely painful*
	P 3		Extension	+	0	0	*Very active*
			Rotation				*Marked quadriceps wasting*
Ankle	*S 1*	—	Dorsi flexion	10	10	10°	*Very little change*
	P 0	—	Plantar flexion	20	20	20	
Subastrag & Midtars	*S 0*	—	Inversion	0	0	0	*Bony ankylosis*
	P 0	*Extreme*	Eversion	0	0	0	
Midtars & Tars Met	*S 0*	—	Adduction	<5°			*Fibrous ankylosis*
	P 1	*10*	Abduction	0			
		—	Dorsi flexion	<5°	—	—	
		—	Plantar flexion	0			
Metatarso Phalang First		—	Dorsi flexion	±20	20°	20°	*Hallux valgus*
	S 1	—	Plantar flexion	±10	0	0	*Active*
	P 2	—	Abduction	±10	0	0	
		45°	Adduction	0	0	0	
2	*S1 P0*	*30 extn*					*Old Kohler*
3	*S0 P0*	*20*					
4	*S0 P0*	*20°*					*No active disease*
5	*S0 P0*	*10°*					
Interphal Proximal 1	*S0 P1*	*Clawed*					*No active disease*
2	*S0 P0*						
3	*S0 P0*						
4	*S0 P0*						
5	*S0 P1*						
Distal 2	*S0 P0*						
3	*S0 P0*						
4	*S0 P0*						
5	*S0 P0*						

S Amount of Swelling *0*—Nil *1*—Appreciable *2*—Synovial thickening+ fluid —Hydrops

P—Amount of Pain *0*—Nil *1*—Only at extremes of movement —Through full range —Also present at rest

* Degrees of movement and of deformity are from the normal anatomical position.

A similar chart is used for the upper extremity

Optimum Physiological Positions for Rheumatoid Joints

No hard-and-fast rule can be laid down which is applicable to every case and joint, but certain positions may be given as a guide for the majority of cases (Charts 2 and 3) Generally speaking, these positions are equally suitable for the earlier treatment to preserve and to restore function as for the prevention of disabling deformity should ankylosis be inevitable

CHART 2

OPTIMUM PHYSIOLOGICAL POSITIONS (Upper Extremity)

Joint	Position	Remarks
Shoulder	Abduction 45 Flexion 30 External rotation 30° on left Nil on right	Minimizes possibility of adduction contracture Assists restoration of abduction Favours circulatory flow to whole upper extremity by removing dress across 1st rib Allows of abduction and adduction of the upper extremity through rotation of scapula if ankylosis occurs Permits hand to be used in front of mental plane left side to mouth for feeding right side at table for writing or bench work
Elbow	*Right* at about 80 (that is full extension less 80) *Left* at about 105° (that is full extension less 105°)	Positions to be varied according to patient's occupation The positions given permit right hand use for table knife and writing and left hand for table fork both in knitting and sewing
Radio ulnar	*Left* Mid position *Right* Slightly more pronation	The right forearm is more commonly used in pronation
Wrist	*Dorsiflexion* so that posterior metacarpal surface makes angle of 25° with line of centre of forearm	In this position the thumb metacarpal in its neutral position continues the line of the forearm
Fingers (including metacarpophalangeal joints) Thumb (including metacarpophalangeal joints)	Each joint slightly flexed Opposed and flexed sufficiently to enable its tip to touch tips of index and middle fingers	Position of semi grasp

The above positions are based upon the individual being a right handed person

CHART 3

OPTIMUM PHYSIOLOGICAL POSITIONS (Trunk and Lower Extremity)

Joint	Position	Remarks
Spine	Preservation of normal antero posterior curves	Avoid lumbar lordosis
Hip	*Single joint* 25 flexion Neutral abduction adduction No rotation *Both joints* Few degrees abduction otherwise the same as for single joint	When lumbar spine also involved and if ankylosis of both inevitable then possibility of more flexion of hips to permit greater ease of sitting to be decided with patient's wishes—walking of course more difficult
Knee	Flexion 15 to 25	Full extension to be avoided—through possibility of neuritis of sciatic nerve or its peroneal branch
Ankle	Plantar flexion 10	Permits use of heeled shoes
Tarsus	Slightly pronated	Avoid high arched varus position A relatively broad weight bearing surface prevents painful pressure points
Toes	Anatomical position	Avoid claw position

Retentive Apparatus

There is little disagreement that plaster of Paris forms the best type of splintage available because it can be made to fit a limb exactly and because it can be readily converted from a splint maintaining almost absolute immobility to one that when the indications permit, can be removed for physical therapy Personally I favour the use of well made hospital bandages as are available in orthopaedic hospitals where such material is produced on a large scale Where perfect bandages cannot be obtained there are good manufactured substitutes which are infinitely preferable to the bandages made by nurses unpractised in the art There appears to be a vogue extending from the field of fracture treatment to that for arthritis in which the unpadded plaster mould is used as a splint Possibly I am a reactionary but I think it is unnecessary it is disagreeable to the patient and to my mind is a confession of poor plaster technique I would make a plea for the greater comfort of the patient when held in a padded plaster, which, both in the treatment of fractures and of arthritis need not and should not contain an exuberance of padding Stockinet with a thin cellulose covering does not materially reduce efficiency and is warmer and less irritating to the patient's skin besides offering an opportunity for ventilation which is so desirable owing to the clamminess often encountered

There is one position in which I agree that the initial mould can best be of the unpadded type and that is for the wrist and hand where with small joints it certainly is difficult to obtain perfect approximation to limb surfaces

Space does not permit of detailed instructions for each joint The shoulder is not really suitable for plaster application for its use here involves extension on to the trunk a matter that should be avoided owing to possible interference with respiratory function I regard the full development of respiratory capacity as fundamental in the general treatment of the disease For the shoulder there are available adjustable abduction splints which are both light and efficient and which can be used in conjunction with plaster for the distal portions of the limb

Reconstructive Orthopaedics by Manipulative and Operative Surgery

Much of the work described under this heading should not be necessary if the methods of treatment already dealt with by Dr Edgecombe and myself have been adequately carried out Unfortunately facilities for this treatment are either not sufficiently available or are not sufficiently made use of Patients with appalling deformities and disabilities continue all too frequently to come for treatment Even for these pathetic cases there is no reason for the attitude of hopelessness with which they are so often regarded

Deformity of the knees is one of the most common and serious problems When these joints are severely flexed the patient is led to early confinement in bed or wheel chair and accordingly suffers from the unfavourable reaction that this exerts upon the general course of the disease Not only do deformities occur secondarily in the feet and hip but the general metabolic state is depressed and increasing generalized bone absorption from disuse occurs I venture to suggest that such mobilization of the calcium reserves may itself be an important factor in the stiffening process throughout the rest of the body

The correction of flexion deformity of the knees when ankylosis is not present can readily be carried out It is important however that during the process the joint be securely held at rest for by this means the correction can be made relatively painlessly The use of a double inclined plane splint with traction is not to be recommended as it does not satisfactorily maintain immobilization For the severer deformities amounting to 90 degrees or more the correction may be begun by manipulation under an anaesthetic This manipulation is not forced so is to cause extensive tearing of capsular tissues but is merely enough to stretch the contracted hamstring muscles to their limit In less severe cases manipulation under anaesthetic is not necessary In both types of case after suitable manual correction has been obtained a plaster cast is applied from the groin to the ankle which is well padded behind both these points and with an extra thick pad in front of the knee When dry a cut is made around the back and sides of the plaster transversely The plaster shell is thus almost divided into two but is left solid in front of the knee Into the gap thus made thin wooden blocks are inserted daily in order to wedge the two portions apart and thus straighten the knee the amount of correction obtained each day stopping just short of pain Pain in front of the patella always commands relaxation of correction During the process of correction the wooden blocks may be removed each day so that the joint may be exercised through the range of corrected movement

A very excellent modification of this method is provided by the use of a metal hinge piece of the Zimmer type joining the two halves of the plaster instead of the bridge of plaster in front of the knee The great advantage of this is that a greater range of controlled movement may be given each day and pressure upon the patella is avoided As soon as possible and usually long before full correction is obtained the patient should be encouraged to become ambulatory

In the correction of any deformity the principles of Hoffa should be borne in mind (1) mobilization and correction (2) retention (3) re education Therefore when the knee flexion is corrected bivalved plaster splints or light callipers should be used while re education of the quadriceps and the fullest development of active movement are achieved

Elsewhere in the body the same principles should be employed Where necessary manipulations under nitrous oxide or evipan are carried out retentive plaster moulds applied and hydrotherapy and other forms of physical therapy given with the education of muscular control and active movements Where possible interesting occupations must also be provided to encourage these movements and in the case of the hands the useful occupation of knitting is really valuable

Concerning manipulation a word of warning is necessary for I believe that one should as a rule be satisfied with small corrections at any one time If ligaments with osteoporotic surroundings are torn from their attachments, I believe fibrositic reactions may develop (akin to the fibrositis ossificans after fracture of the elbow) and the affected joint afterwards become stiffer rather than looser

Operations

Synovectomy is an operation having a limited scope In osteo arthritis particularly of the traumatic type it is of great value There are certain cases of rheumatoid arthritis however in which synovial effusion with pain is a marked feature and which do not respond well to more conservative measures, in weight bearing joints

particularly I have carried out the operation in a few of these rheumatoid joints, removing as much as possible of the synovial membrane, the results being surprisingly good The most remarkable feature is the development afterwards of a new synovial sac

Patellectomy —Brooke has shown how well patients can manage without a patella, and for those individuals with ankylosis of the patella to the femur I do not hesitate to remove it

Osteotomy particularly in ankylosis with deformity of the wrist-, hip-, knee-, and foot-joints, is a most valuable and simple procedure, the positions obtained being those already discussed In most cases the site of osteotomy is at the old joint line, but for hip deformities it is intertrochanteric If the ankylosis of the hip is fibrous then the bifurcation type of osteotomy is done, with displacement of the shaft beneath the acetabulum as devised by McMurray

Arthroplasty has its greatest sphere of usefulness in non-weight-bearing joints such as the temporo mandibular and elbow The best results are obtained in cases previously having bony ankylosis It is very important to remove an ample amount of intervening bone For the hip-joint, where it would often be desirable to obtain free movement, particularly in bilateral ankylosis, the successes are not very frequent For the distressing cases of spondylose rhizomelique, in which both hips and spine are ankylosed, it is worth making a good effort to obtain at least one movable hip The method recently described by Girdlestone of removing the entire head and neck of the femur offers great encouragement in this direction

Arthrodesis —In a disease that tends to produce ankylosis, arthrodesis is not commonly required In the wrist and foot, however, painful fibrous ankylosis with or without deformity, may have to be dealt with by this fixation operation Subastragaloid arthrodesis may enable a patient to walk who is otherwise crippled by pain, and for distressing multiple claw-toe deformities Lambrinudi's method of multiple interphalangeal arthrodesis gives most remarkable results, and to the patient pleasing relief

---

J Tourtı (*These Paris* 1938 No 121), who records six cases in patients aged from 22 to 63, illustrates the rarity of osteoperiostitis in the enteric fevers by drawing attention to the fact that only four cases were encountered in a series of 1,600 typhoid patients The condition is most frequent in young subjects, its incidence being highest under 25, and it is very rare above the age of 35, although it is occasionally found in elderly persons The complication is most commonly met with in atypical forms of the fever in individuals who have not acquired a high degree of immunity against the specific bacillus and are apt to show a low degree of agglutination It is due to persistence in the bone marrow of the bacillus, which gives rise to circumscribed lesions and behaves like a pyogenic organism The osteo periostitis may appear at an early or late stage of the fever, but in the great majority of cases it develops six to eight weeks after the onset, and sometimes not till several years later The commonest organism is *Bact typhosum* *Bact paratyphosum* B comes next and *Bact paratyphosum* A is hardly ever found In some cases the typhoid or paratyphoid organism may disappear and be replaced by secondary invaders, such as the streptococcus staphylococcus pneumococcus, or *B coli* in which case the prognosis is usually grave As a rule, however the outlook is favourable, and in spite of the slow course and frequency of relapse complete recovery takes place In non suppurative forms vaccine treatment alone is required In some acute suppurative forms operation may suffice but usually both vaccine and operation are employed

EFFECT OF SPONTANEOUS JAUNDICE ON RHEUMATOID (ATROPHIC) ARTHRITIS*

ATTEMPTS TO REPRODUCE THE PHENOMENON

BY

PHILIP S HENCH, M D.

Division of Medicine The Mayo Clinic Rochester, Minnesota

When patients with rheumatoid (atrophic, chronic infectious) arthritis or with primary fibrositis become definitely jaundiced a notable event usually occurs their rheumatic symptoms are rapidly, markedly, and generally completely alleviated for some weeks or months My first observations on this phenomenon were reported in 1933 and later (Hench, 1933a, 1933b, 1934, 1935) This phenomenon was unmentioned in the modern literature on rheumatic diseases, but was casually noted by Still in 1897, by Wishart in 1903, and in three recent discussions, not on arthritis but on cinchophen toxicity (Parsons and Harding, 1932a, 1932b, Grigg and Jacobsen, 1933) More recently further observations on the phenomenon were reported by Sidel and Abrams (1934), and by Borman (1936) Heretofore the possible significance of the phenomenon has not been fully appreciated

Recently I presented further observations (Hench, 1937, 1938a, 1938b) on two new groups of cases (1) studies on thirty-one additional rheumatic patients who experienced the phenomenon, and (2), of equal importance, studies on four patients with rheumatoid arthritis and on nine patients with other types of articular and neuritic complaints who were *not* relieved of symptoms coincident with jaundice These observations will be summarized briefly

Effect of Spontaneous Jaundice

Symptomatic remissions lasting from five to ninety two (average 19 5) weeks occurred in nineteen cases of rheumatoid arthritis (average 5 5 years' duration) in which intrahepatic or obstructive jaundice lasted an average of nine weeks Remissions continuing for four to 104 weeks occurred in nine cases of fibrositis in which the jaundice lasted an average of 5 6 weeks Two patients with lumbo-sacral and sciatic pain and one with secondary hypertrophic arthritis of the hips associated with "Otto pelvis" experienced jaundice and symptomatic remissions, both jaundice and remissions lasting an average of five weeks The degree of symptomatic relief was complete for 100 per cent of the fibrositic and for 63 per cent of the arthritic patients, 37 per cent of the arthritic patients had marked but incomplete relief "Relief" implies notable or complete amelioration of the symptoms of active disease Articular pain, active articular swelling, and muscular stiffness, soreness, and fatigue were considerably reduced or disappeared Residual articular thickening and stiffness from deformity were, of course, unaffected Nevertheless a moderately severe spontaneous jaundice was able to evoke a remission even in a case of long-standing very severe rheumatoid arthritis

Four patients experienced more than one attack of jaundice, attacks of mild jaundice did not produce remissions in rheumatic symptoms, but when the jaundice was more intense the phenomenon of relief was repeated

* Communicated to the International Conference on Rheumatic Diseases, Bath, 1938

with each attack of jaundice No cumulative effect was noted subsequent remissions not necessarily being longer than the first When the phenomenon is evoked the beneficial effects of jaundice generally make their appearance promptly with the onset of jaundice usually within the first two or three days of the onset of visible icterus The phenomenon was quite obvious to those affected and they usually volunteered certain characteristic and significant remarks to relatives and friends such as When the jaundice came in at the front door the rheumatism went out by the back door Spontaneous jaundice induced a remission not a cure Remissions lasted from three weeks to several months they averaged (roughly) from two to three times the average duration of the jaundice Subsequently rheumatic symptoms returned as before in 48 per cent of cases less intensely in 39 per cent In a few cases symptoms are still absent

The phenomenon is apparently dependent more on the quantity than on the type of the jaundice it accompanied catarrhal infectious or spontaneous (intrahepatic) jaundice cinchophen jaundice and also obstructive jaundice from stones or malignancy A mild jaundice is apparently ineffective the zone of therapeutic effectiveness seeming to begin at and to continue above a level of about 8 mg of bilirubin per 100 c cm of serum Four patients with mild jaundice (with a serum bilirubin below 4 or 5 mg per 100 c cm) noted no relief from their rheumatoid arthritis

Since intercurrent jaundice of several types and degrees of severity did not alleviate painful symptoms of a few patients with other conditions such as gouty arthritis toxic or infectious arthralgia, juxta articular malignancy ischaemic neuritis, post herpetic neuralgia (Hench 1937 1938a 1938b), the phenomenon appears (so far) to be relatively specific for rheumatoid arthritis and primary fibrositis Conclusions on the specificity of the phenomenon are not final it may be found that the phenomenon may have a wider field of exhibition (and utilization) than in these rheumatic diseases and some more basic immunological response may be involved

Therapeutic Implications

The therapeutic implications are obvious An intensive study of the phenomenon—Nature's trick way of stopping the disease rapidly even if temporarily—may give us a clue to the pathogenesis of the disease and a clearer understanding of the immunity mechanism involved Perhaps it may even lead to some superior method of treatment by which we can reproduce the phenomenon of remission at will Jaundice obviously provides not a cure but a temporary control at least of symptoms But is it not likely that the differences between a preliminary temporary remission and the final permanent remission which we call a cure are merely quantitative—differences of degree and of persistence? Recently new successes in the treatment of certain diseases have rewarded those willing to follow Nature's lead no matter how irrational that lead seemed instead of continuing methods that were rational but relatively unsuccessful There was no rationale for the use of malaria in neurosyphilis Originally, behind this venture was simply the unexplained fact that 'it worked So there is to date no particular rationale for the use of artificial jaundice in rheumatic diseases The history of the therapeutics of rheumatoid arthritis is filled with the ghosts of rational treatments which should have helped but didn't In this instance guided by the exposition of this phenomenon—one of Nature's revealing slips —a return to the empiric might be fruitful With this in mind we began a search for the agent responsible for the phenomenon and the mechanism whereby it is motivated

Speculations Concerning the Factor Responsible for the Phenomenon

The responsible factor may be a chemical agent This agent—substance X—may be a normal constituent of bile (bilirubin bile salts mucin or a lipoid) an abnormal hepatic substance such as a hepatic autolysate a product of hepatic damage or it may be an extrahepatic substance formed or activated elsewhere than in the liver as the indirect result of jaundice On the other hand it has been suggested that the responsible factor is not a chemical substance but some circumstance incident to jaundice simple sedation rest and reduction of trauma dietary restriction dehydration counter irritation

1 *Bilirubin*—The phenomenon occurs consistently in the presence of a fairly intense hyperbilirubinaemia but is generally absent when hyperbilirubinaemia is absent or slight Thus bilirubin might seem to some to be the most likely agent It has been suggested that perhaps the tissues of arthritic patients lack sufficient bilirubin and jaundice supplies the deficiency Recently Race (1937) noted that in patients with rheumatoid arthritis the icterus index and concentration of serum bilirubin were somewhat low The bilirubin deficiency however was small and was not the chief cause of the low icterus index For various reasons I believe that bilirubin may not be the responsible agent at least not the sole or ultimate agent though it may be an intermediary Bilirubin is generally regarded as a substance which physiologically is relatively inert Perhaps bilirubin plays no part in the phenomenon and is only an index of severity of the hepatic damage some by product of which is the factor responsible for the relief Rather complete remissions of symptoms of rheumatoid arthritis may be induced by states other than jaundice notably by pregnancy (Hench 1938c) in which hyperbilirubinaemia does not occur though tests of bilirubin excretion may show some retention (Soffer 1933) Nature probably does not cure arthritis even temporarily in two totally different ways Although the mechanism for developing the agent may be different is it not probable that in the last analysis the ameliorating agent is the same both in pregnancy and in jaundice? If this is true one must conclude either that bilirubin is not responsible at all or that an amount of bilirubin that will produce icterus is unnecessary for the phenomenon Perhaps in the presence of pregnancy or of jaundice a special potent form a derivative or compound of bilirubin and not ordinary bilirubin is the responsible agent and one effective even in amounts that do not cause pigmentation

Another reason for debating the possibility of bilirubin being the responsible factor is that in jaundiced arthritic patients the relation between the depth of jaundice and the phenomenon of symptomatic relief although close was not absolute Frequently analgesia lasted long after the bilirubin in the serum (and presumably in the tissues) had returned to normal Furthermore several patients apparently noted relief even before their jaundice was visible If that be true either no excess of bilirubin is necessary or only a slight excess is required to produce the phenomenon But since other observations on the ineffectiveness of slight even if definitely visible jaundice (4 to 6 mg. of serum bilirubin) have made the latter deduction at present untenable no final conclusion as to the role of bilirubin can now be made

2 *Bile Salts*—Bile salts are apparently increased in the blood in certain types of hepatic disease with jaundice decreased in others Bile salts in high concentration may retard the growth of certain bacteria Until accurate methods are available for determining their concentration in blood the role of bile salts in the phenomenon under discussion is speculative

3 *Hepatic Autolysate*—It would seem more likely that the responsible agent is a product which is normal not abnormal,

to tissues helped thereby Nevertheless, a product of hepatic injury may be the responsible agent The possible value of extracts of normal and abnormal livers is being investigated

4 *Special Diet*—In one of Pemberton's patients (Pemberton, 1920 Case 53) the joints entirely cleared up during acute catarrhal jaundice He ascribed the relief not to jaundice but to the incidental period of low feeding or even 'starvation' entailed (Pemberton 1920, 1935) In my cases, however, a diet low in calories or carbohydrates was not the responsible factor since to most of the patients a supportive diet for hepatic disease' (400 to 500 grammes of carbohydrates daily) was prescribed which they continued for from three to five weeks while in the hospital (generally with an additional 100 grammes of glucose intravenously daily) and for from three to six months thereafter Despite this the phenomenon was not interrupted

5 *Simple Sedation*—It has been suggested that in jaundice the sensorium is dulled by toxins producing a simple sedation or non specific reduction of pain perception This explanation is unsatisfactory It could hardly explain diminution of swelling and stiffness also Furthermore, most of the affected patients were quite alert mentally and physically despite their jaundice (as my photographs and motion pictures demonstrate) If jaundice provided simple sedation, should not the patients with gout, juxta-articular malignancy neuritis, or neuralgia have noted relief during jaundice?

6 *Counter irritation*—It has been suggested that jaundice provided counter-irritation that the patients were too sick from jaundice to notice their joints On the contrary they particularly noticed their joints because of the surprising relief obtained therein

7 *Rest and Reduction of Trauma*—These were not the responsible factors Most of the patients, freed from rheumatic pains during jaundice, were not less active but more active than for months or years, as their cited quotations indicate

8 *Dehydration*—This is said to relieve arthritic patients somewhat (Scull and Pemberton, 1935) In my cases dehydration was not noticeable Indeed, large amounts of fluid were generally given, not because of dehydration but to combat toxicity Despite the large intake of fluid, analgesia persisted

Speculations Concerning the Mechanism Whereby the Agent May Act

Assuming the responsible agent to be a chemical substance or compound, and not an incidental circumstance, the phenomenon may result from (1) the correction of some chemical deficiency, (2) the correction of some chemical over-sufficiency, or (3) an immunological process involving bacteriolysis, bacteriostasis, or detoxication

1 Though an attractive idea, it remains to be proved that jaundice provides to tissues involved in arthritis and fibrositis some chemical constituent adequate amounts of which the rheumatic patient did not previously possess

2 Presenting the opposite view, perhaps hepatitis and jaundice correct some hyperfunctioning and not a hypofunctioning state, the hepatic damage temporarily lowering the production of some substance of which rheumatic patients have an oversupply Were this so, severe hepatitis alone, without jaundice, might be expected to invoke the phenomenon, but it did not in one case (Hench, 1934, Case 17, first series)

3 Perhaps the agent, substance X, possesses the property of detoxication, bacteriolysis, or bacteriostasis in respect to the organisms responsible for chronic rheumatism Bile is bacteriolytic to pneumococci Our preliminary studies have failed to show any bacteriolytic or bacteriostatic effect on certain arthrotropic, neurotropic, or neuromyotropic streptococci *in vitro* using concentrations of bilirubin and bile salts (alone or together) equal to or greater than those of clinical (or experimental) jaundice Furthermore, arthrotropic streptococci could still be isolated from foci of patients enjoying the phenomenon

I have not discussed the effect of jaundice on the physical properties of blood—colloidal osmotic pressure, surface tension, viscosity, haemoglobin-oxygen stability, and so forth Further speculations on those phases of the problem are useless at present

Attempts to Reproduce the Phenomenon

It was decided to administer to rheumatic volunteers the different available constituents of bile, first alone and then in combination, and first by the simpler routes (oral, rectal) and later intravenously or otherwise Bilirubin was not used first because of reasons just noted, and because of its cost ($25 a gramme) and relative unavailability at the onset of this work

Bile Salts—Many preparations are available 'Glycotauro" (Hynson, Wescott and Dunning) was given orally in doses up to 15 grammes in fourteen days Ox gall was administered in doses up to 60 grammes in thirteen days These doses are equal to or above those usually prescribed The results were questionable

Synthetic Bile Salts—Sodium dehydrocholate ('decholin,' Riedel de Haen) was given intravenously, orally, and in combination Several patients received 2 grammes intravenously for from eight to twenty-one days, or the tablets (each 0·25 gramme) orally in doses up to a total of 44·5 grammes in twenty one days The results were questionable some patients felt somewhat relieved, but it was evident that ordinary doses of this and the previous preparations, given alone, would not precipitate the complete phenomenon Recently Sidel, Thompson, Rawls, and Margolis (in a discussion of my article) reached the same conclusion

Diluted Ox Bile—Sterile ox bile diluted in water and olive oil was given by proctoclysis, but proved irritating and was promptly evacuated

Human Bile—Amounts of human bile up to 2,600 c.cm on one day (7,650 c.cm in ten days) were given by stomach tube Anticipating that this bile probably would circulate only through the entero hepatic circulation and never reach the general or articular circulation, I was not surprised that the concentration of serum bilirubin was not increased and that no relief resulted Patients took the bile well, one took it with pleasure, saying it increased his appetite

Liver Extracts—Ordinary doses of commercial liver extract which I have occasionally used in treating arthritic patients with secondary or with coincident pernicious anaemia never appeared to affect articular symptoms This has also been the observation of Drs George Minot and William Murphy (personal communication) Hence this method of approach has not been extensively explored Reasoning that the effective agent might be a product of hepatic degeneration, Margolis (1937) gave McElroy's liver autolysate intravenously to two patients with rheumatoid arthritis Exacerbations of pain, stiffness, and soreness were obtained

Transfusions of Highly Jaundiced Blood—To my knowledge, jaundiced blood has not heretofore been deliberately used for transfusion Hoping that potent amounts of substance X might be present in portions of jaundiced blood available for transfusions, four arthritic patients received one to four such transfusions Round-robin transfusions' were arranged non arthritic jaundiced patients with various hepatic disorders donated amounts of (Wassermann negative, sterile) bad blood in return for twice as much good blood from healthy donors the jaundiced blood was injected into non jaundiced arthritic patients in the usual manner, with only a slight reaction or no more than from any transfusion One patient in her fourth transfusion received 800 c.cm of jaundiced blood containing 21 mg. of bilirubin per 100 c.cm (actually only 168 mg of bilirubin) The next day she insisted that she had less pain, if so, relief was transient, and the serum bilirubin was immaterially increased

Artificial Jaundice—Since these various methods used to reproduce the phenomenon were employed only on small numbers of patients they should not be hastily dismissed as useless But obviously the complete phenomenon provided by spontaneous jaundice was not being reproduced thereby Rather than persist in these methods it was decided to postpone further investigation along these lines and to attempt to obtain by some other method an effect comparable to the phenomenon described not the slow equivocal type of improvement which the current methods already provided It seemed necessary to effect a reproducible relatively harmless type of jaundice in order to study satisfactorily the physicochemical intricacies of the phenomenon

Toluylenediamine Jaundice—Certain studies (Wolff 1934 McGowan 1935 McGowan Bollman and Mann 1936) suggested that toluylenediamine might be a suitable substance to use in the first deliberate attempt to induce jaundice experimentally in man Toluylenediamine jaundice in animals was intense was rather controllable was intrahepatic in type and produced no significant detectable functional or pathologic residue In June 1936 an arthritic patient who was discouraged after thirteen years of suffering from a condition that had progressed in spite of all manner of therapy elected to take toluylenediamine orally Contrary to expectations the induced jaundice was wholly of the haemolytic type it was transient and rather mild the maximal concentration of bilirubin being only 6 3 mg. (direct reaction) not entering the zone of therapeutic effectiveness No relief of joint symptoms resulted The chemical produced considerable gastro intestinal irritation Further details will be reported elsewhere

Induced Hyperbilirubinaemia—More recently Thompson and Wyatt (1937 1938) noted that the intravenous administration of bile salts alone (decholin 2 grammes daily for nine to twelve days) was without beneficial effect in ten cases of rheumatoid arthritis as were injections of bilirubin alone (10 to 15 mg. per kilogramme daily for several days) in three cases They noted however that injections of bilirubin (10 mg per kilogramme) and decholin (40 mg per kilogramme) in combination produced an ameliorating effect which apparently duplicates the effects of clinical jaundice The bilirubin-decholin combination produced a slightly higher and more persistent hyperbilirubinaemia than injections of bilirubin alone Except for a few febrile reactions no evidences of toxicity were noted in the patients or animals that had been given the injections

At the last conference of the American Rheumatism Association (June 1937) Thompson presented the preliminary results of these experiments Injections of bilirubin and decholin were given to ten patients daily for from seven to eleven days Each day the injected bilirubin was rapidly but incompletely excreted so that with repeated doses the tissues retained enough to produce definite hyperbilirubinaemia and icterus Thompson and Wyatt reported that in these ten cases diminished swelling was noted after from one to nine injections Analgesia (at first partial) was observed after from one to seven injections and persisted for varying periods the shortest period being twelve days At the time of their report analgesia had been maintained in one case for five months in another for five and a half months in others for two months one month and one month respectively In November 1937 I visited Drs Thompson and Wyatt Their results at that time (which are here given with their permission) were as follows They had administered from six to twelve injections of bilirubin and decholin to a total of thirteen patients whose disease had lasted from three to eight years Of these thirteen cases long remissions (from two to eight months) had been precipitated in four cases short remissions (five to forty days) in six and no results had been obtained in three (Two other patients were under treatment) With regard to the three cases in which no results were obtained (1) one patient with muscular pains stopped treatment after six doses (2) a woman with severe rheumatoid arthritis was unrelieved after twelve doses and (3) a spondylitic patient noted slight analgesia after the second dose and considerable analgesia but no increased mobility after nine doses the analgesia persisted only ten days after which he had a severe exacerbation

Preliminary Results with Induced Hyperbilirubinaemia

A few weeks before presenting his preliminary results Dr Thompson kindly acquainted me with this work in order that I might attempt its confirmation The technique of preparation and administration is not as simple as it sounds It is not simply a question of dissolving bilirubin in any alkali adding bile salts and then injecting the mixture To date it appears that the solution must be made fresh daily (a matter of about two hours work) administered promptly and according to Thompson kept from sunlight constantly (possibly to prevent oxidation of bilirubin at least it tends to minimize reactions) It remains to be proved how necessary some of these procedures are Most commercial bilirubin is rather impure Although the samples of bilirubin we are both using are becoming purer they still contain impurities The strongly alkaline mixture continues to irritate the veins and causes frequent thromboses so that the matter of giving a number of consecutive daily injections often becomes a problem In an attempt to avoid thrombosis we buffered the solution to approximate neutrality just before the injection in two cases This markedly altered the results, no significant hyperbilirubinaemia and no symptomatic relief was obtained In spite of technical difficulties however we at the clinic have at least partially confirmed the work of Thompson and Wyatt By this procedure one can produce a definite apparently non toxic pigmenting hyperbilirubinaemia Using the larger dose of bilirubin (15 mg per kilogramme) more frequently than Thompson we have produced degrees of hyperbilirubinaemia in which the peak concentrations (just after the solution is injected) have reached 20 to 35 mg and the retention levels twenty four hours after injection (and just before another injection) rose to as high as 12 5 mg of bilirubin per 100 c cm of serum

To date my colleagues and I have treated twelve patients—eleven with rheumatoid arthritis and one with primary fibrositis Rarely obtaining any significant effect from six to twelve injections we have sometimes given twelve to twenty and in a few cases from twenty five to thirty consecutive daily injections Little or no benefit was obtained in five cases (including the two in which the solutions were buffered) One patient had a rather complete temporary remission in symptoms but only for about three weeks which is the longest and most definite effect obtained Short incomplete remissions apparently resulted in six cases for a few days only in three of these six cases the reduction in symptoms seemed slight but definite in the other three it was more definite but was still incomplete and very transient One of these six patients accepted two courses of injections the first course included seventeen doses the second twelve doses[1] He was markedly icteric but the effect was mild if there was any At the start attempting by correspondence to collaborate in the development of a new technique we made three slight changes in technique which we believed were insignificant[2] Correcting these differences however has not brought about a relief com-

[1] The first seventeen doses were prepared by our modification of Thompson's technique but the twelve doses of the second course were prepared exactly according to Thompson's technique

[2] In the method of Thompson and Wyatt bilirubin is dissolved in monohydrated sodium carbonate we used anhydrous sodium carbonate solutions in both cases being one tenth normal When the bilirubin was thoroughly dissolved Thompson filtered the solution through a Seitz filter To facilitate the Seitz filtration we first filtered the solution through a thin layer of infusorial earth. Decholin was added by Thompson after the Seitz filtration by us before the filtration These differences in technique seem immaterial

parable to that produced by spontaneous jaundice The failure to produce constantly any lasting relief by such injections has convinced me that it is necessary to study this problem from many other angles in order to establish the influence of the various factors involved

Preliminary Appraisal—It is too early to evaluate the procedure fully By it one can produce an apparently harmless artificial "jaundice' or hyperbilirubinaemia which may be utilized to advantage in the study of a number of physiological and clinical problems Only by some such method can we determine what part, if any, bilirubin plays in the phenomenon which spontaneous jaundice induces Regardless of the slight, and to my way of thinking unimportant, differences in technique, my results, and those of Thompson and Wyatt, speak for themselves A number of my patients have been made markedly icteric and had concentrations of serum bilirubin that should have been effective were bilirubin in just any form the potent factor, the results, however, have been equivocal or incomplete Obviously the method is not yet reproducing the full effect which spontaneous jaundice evokes But the fact that any effect, no matter how incomplete or transient, can be so induced, even inconstantly, seems significant So far, however, one must clearly differentiate the effects of spontaneous jaundice from those of induced hyperbilirubinaemia

Since the results were so often equivocal, the procedure of inducing hyperbilirubinaemia has been difficult to evaluate It seems to me best to regard it as a worthy preliminary venture which may provide a rather crude and inconsistent approximation of the more dramatic and complete effect of spontaneous jaundice Certainly in its present form it is by no means a "control of arthritis', nor is it yet a practical procedure, because it is expensive, time consuming, and (most important) inconstantly and incompletely effective Regarding it as promising research, I agree with Thompson that to exploit the use of bilirubin and bile salts for the treatment of arthritis at this time is unwarranted and most undesirable

Summary and Conclusions

Jaundice involves a physiological reaction which is antagonistic to the continuation of active symptoms of rheumatoid arthritis and primary fibrositis With the onset of any one of several types of jaundice, rather dramatic remissions in rheumatic symptoms, lasting from three to 104 weeks, occurred in nineteen cases of rheumatoid arthritis, in nine of primary intramuscular or periarticular fibrositis, in two of lumbo-sacral and sciatic pain, and in one of secondary hypertrophic arthritis of the hips Remissions averaged (roughly) from two to three times the average duration of the jaundice and affected symptoms of active disease, residual articular thickening and disability from deformity were unaffected

The phenomenon depends more on the quantity than on the quality (or type) of jaundice, a certain intensity of jaundice being required Since intercurrent jaundice of several types and various degrees of severity did not alleviate symptoms of certain other painful articular and neuritic diseases, the phenomenon may be relatively specific for rheumatoid arthritis and fibrositis This conclusion is tentative, perhaps the exhibition and application of the phenomenon may be possible in other conditions

The therapeutic implications are obvious a study of the phenomenon may enhance our knowledge of the pathogenesis of these diseases and may lead to some superior method of treatment The responsible agent and the mechanism whereby it operates have not been identified, certain hypotheses concerning them have been entertained Several methods involving the administration of various components of bile and the production of artificial jaundice and induced hyperbilirubinaemia are being used in an attempt to reproduce the phenomenon "Therapeutic jaundice" is an attractive term, but even if what it implies can be successfully accomplished, it should be regarded not as an end in itself but as a means to an end, a rather crude form of treatment which is just a step, but perhaps an important one, on the way to the refined therapy of the future

Regardless of what further investigations bring forth, four conclusions are made now

1 The condition of jaundice is not entirely malevolent, it may initiate a phenomenon distinctly, if temporarily, beneficial to patients with certain diseases, particularly rheumatoid arthritis and fibrositis

2 Rheumatoid arthritis and fibrositis can no longer be regarded as necessarily relentless uncontrollable diseases for which no really satisfactory rapid method of control should ever be expected Certain of their pathological changes may be permanent, but their pathological physiology is more rapidly reversible than previously supposed, indeed, it may be dramatically reversible

3 Regardless of the supposed validity of the infectious theory, obviously rheumatoid arthritis and fibrositis can be profoundly influenced by a phenomenon primarily chemical

4 Nature possesses a highly effective method of producing dramatic remissions involving a phenomenon which is precipitated more rapidly by jaundice than by any other physiological or therapeutic method The next step belongs to the future It is important for us to identify Nature's dramatic, if accidental, antidote

SULPHAMIDO-CHRYSOIDINE SULPHANILAMIDE, AND BENZYLSULPHANILAMIDE IN THE TREATMENT OF ERYSIPELAS

A CONTROLLED SERIES OF 242 CASES

BY

W. R. SNODGRASS, M.A., B.Sc., M.D., F.R.F.P.S.G.

Assistant Physician Western Infirmary Glasgow

T. ANDERSON, M.B., Ch.B., M.R.C.P.Ed.

Deputy Superintendent Ruchill Hospital Glasgow

AND

J. L. RENNIE, M.B., Ch.B., D.P.H.

Assistant Medical Officer of Health Burgh of Ayr late Resident Assistant Physician Ruchill Hospital Glasgow

We have recently published two reports to the Therapeutic Trials Committee of the Medical Research Council on the treatment of erysipelas (Snodgrass and Anderson 1937a, 1937b). In our first report we showed in a controlled series of 312 cases that prontosil red (sulphamido-chrysoidine) was more effective than ultra violet light in that the cases which received sulphamido chrysoidine gave better results in respect of the curtailment of (1) the duration of the spread of the local lesion (2) the duration of primary pyrexia (3) the duration of toxaemia. The evidence supporting these statements was assessed statistically.

In our second report dealing with a controlled series of 270 cases of erysipelas we investigated the action of the derivative of sulphamido-chrysoidine termed *p* amino benzenesulphonamide and commonly called sulphanilamide. Ultra-violet light was again used as the method of treatment for the control series of cases. We once more came to the conclusion that the use of sulphanilamide was better than the use of ultra violet light in respect of the same criteria as in our first report. This evidence was also assessed statistically. The question of the optimum dosage was not determined but it was found that an effective method of treatment was to give 1 gramme of sulphanilamide by mouth at four hourly intervals until the cessation of primary pyrexia and thereafter 0.75 gramme by mouth thrice daily until final cure was determined.

Toxic symptoms in this second series in which large doses of sulphanilamide were used were common amounting to 35.5 per cent. in 270 cases. Cyanosis was the most frequent manifestation and occurred in 29.6 per cent. of cases. It was considered, therefore that further work was necessary in an attempt to settle a minimum adequate dosage for the incidence of cyanosis rapidly increased with an increase in dosage. In our first series employing sulphamido chrysoidine there were only two cases of cyanosis but the average case dosage was 5 grammes and the maximum case dosage 15 grammes. In the second series employing sulphanilamide the average case dosage was 41.6 grammes and in the first two days 14.64 grammes while cyanosis as already stated occurred in 29.6 per cent. of all cases. Thirty nine cases in our second series received more than 6 grammes of sulphanilamide a day during their initial stages of treatment and in this small group the incidence of cyanosis rose to 48.7 per cent. Sulphamido chrysoidine and sulphanilamide are not chemically equivalent drugs nor were they employed in equivalent dosage. It was therefore difficult to compare their therapeutic efficiency as exhibited in our two series of cases. It was thought desirable to undertake a third series of controlled cases with a view to determining this and further it was considered desirable to investigate the anti streptococcal activity in erysipelas of yet another derivative of this group of anti bacterial compounds and so *p* benzylamino benzenesulphonamide was employed. The objects of this third report are therefore (1) To investigate the comparative therapeutic activities of (*a*) sulphamido-chrysoidine (the preparation used was prontosil red Messrs. Bayer Ltd.) (*b*) *p* aminobenzenesulphonamide commonly termed sulphanilamide (the preparation used was streptocide Messrs. Evans Sons Lescher and Webb) (*c*) *p* benzylaminobenzenesulphonamide hereafter referred to as benzylsulphanilamide (the preparation used was prosepasine Messrs. May and Baker Ltd.) (2) To determine an optimum dosage taking into account the question of drug intolerance.

The material consists of all patients over 5 years of age whose case was diagnosed as erysipelas after admission to Ruchill Hospital Glasgow from November 1937 to March 1938. Again our material was thoroughly representative of the incidence of the disease in this district during the period under review. All patients were under the clinical control of T. A. and J. L. R.

Plan of Investigation and Details of Treatment

Part I. 122 Cases.—There were four treatment groups:

A. Benzylsulphanilamide 1 gramme four hourly.
B. Benzylsulphanilamide 2 grammes four hourly.
C. Sulphanilamide 1 gramme four hourly.
D. Sulphanilamide 2 grammes four hourly.

For each group fifteen male patients and fifteen female patients were gathered—the cases being allocated strictly in order of admission. (In each ward male and female one extra case was taken on at the end of the investigation and was retained in the series.)

These cases were admitted during the months of November and December 1937, and early in January 1938.

Part II. 120 Cases.—There were four treatment groups:

A. Sulphamido chrysoidine 1 gramme four hourly.
B. Sulphamido chrysoidine 2 grammes four hourly.
C. Sulphanilamide 0.5 gramme four hourly.
D. Sulphanilamide 0.75 gramme four hourly.

Again each group comprised fifteen male patients and fifteen female patients taken in rotation according to the order of admission. These cases were admitted during the months of January, February and March 1938.

The specific treatment noted above was continued until the temperature of the patient became normal. Thereafter all cases in groups A, B, C and D Part I and groups A and B, Part II received 1 gramme of the drug originally given thrice daily till dismissal from hospital. In respect of groups C and D Part II the original dosage of the drug chosen 0.5 gramme and 0.75 gramme was administered thrice daily.

No local treatment was given and all cases as before were treated under strictly comparable conditions. Full

details of diet and laxatives will be found in our second paper (Snodgrass and Anderson, 1937b), which also recorded the data used to obtain our records of results In a word, this series of cases, apart from specific treatment has been subjected to the same controls and to the same analyses as the preceding series

Assessment of Results

1 The distribution of the individual cases in the two treatment groups must be considered in respect of certain factors known to influence the course of the disease Those regarded as being of greatest importance are (*a*) the duration of the disease before admission to hospital, (*b*) the age of the patient, (c) the severity of the infection (*d*) associated diseases Tables constructed to show the relation of these factors to the types of treatment indicate an even distribution A statistician who has examined them is satisfied that there was no weighting of any one line of treatment by any of these factors

2 The question when "cure" is achieved has to be determined The fatality rate in erysipelas is so low that it cannot be used in a small series of cases to assess the value of a therapeutic measure There is no single clinical feature which can be regarded as a satisfactory criterion of recovery Cases are seen where the lesion continues to spread after the temperature has become normal, and, again, it is not uncommon for the local lesion to cease spreading while the temperature is still elevated and the patient continues in a toxic condition In order to arrive at a conclusion in this series of cases, attention was paid to the following points from the beginning of treatment (i) the duration in days of the spread of the local lesion, (ii) the duration in days of the primary pyrexia, (iii) the time in days which elapsed until the patient was free from toxic symptoms These are the criteria which were used in our previous reports

Results of Treatment

There were five deaths Four of these have been excluded from the following tables* All deaths will be dealt with later in this report The corrected and rearranged numbers for each subsection are therefore

Sulphamido chrysoidine	1 gramme four hourly		30 cases
" "	2 grammes " "		28 "
Sulphanilamide	0·5 gramme " "		30 "
"	0·75 " " "		30 "
"	1 " " "		31 "
"	2 grammes " "		31 "
Benzylsulphanilamide	1 gramme " "		29 "
"	2 grammes " "		29 "
		Total	238 cases

Table I shows that out of fifty-eight cases receiving sulphamido-chrysoidine 86·2 per cent had no further spread of lesion after twenty-four hours, out of 120 cases receiving sulphanilamide the equivalent percentage was 88·3 while out of fifty eight cases receiving benzylsulphanilamide the percentage was only 68·9 The difference between this last percentage and either of the others is more than twice the standard errors of the differences and is considered significant This reflects unfavourably on the effect of benzylsulphanilamide With regard to the various subgroups receiving sulphanilamide little can be said there is a slightly better outcome during the first day for those cases receiving the larger dosages, but the difference is small and cannot be deemed significant

TABLE I—*Spread of Lesion*

Method of Treatment		Duration in Days				Total Cases
		0	1	2	3	
Sulphamido-chrysoidine	1 gm	13 (43·3)	11 (36·7)	6 (20·0)	0	30
	2 gm	11 (39·3)	15 (53·6)	2 (7·1)	0	28

	2 gm	0	9 (31·0)	12 (41·4)	7 (24·1)	0	0	1 (3·5)	0	29
Totals		11 (4·6)	75 (31·5)	90 (37·8)	42 (17·6)	12 (5·0)	4 (1·7)	3 (1·3)	1 (0·4)	238

* The delay here was due to drug fever

Table III shows that out of fifty eight cases receiving sulphamido chrysoidine the percentage having no toxaemia after the third day was 65·6 Out of 122 cases receiving sulphanilamide the equivalent percentage was 59·0 Out of fifty-eight cases receiving benzylsulphanilamide the percentage was 29·3 These percentages reflect unfavourably upon the action of benzylsulphanilamide

One patient died during convalescence and as the local lesion was at the time of death completely cured the case has been returned in the statistical tables

TABLE III—*Toxaemia*

Method of Treatment	Duration in Days								Total Cases
	0	1	2	3	4	5	6	Over 6	
Sulphamido-chrysoidine 1 gm.	0	0	7 (23·3)	13 (43·3)	9 (30·0)	0	1 (3·3)	0	30

Benzylsulphanilamide 2 gm	0	1 (3·5)	0	7 (24·1)	10 (34·5)	8 (27·6)	3 (10·4)	0	29
Totals	2 (0·8)	7 (2·9)	29 (12·2)	89 (37·4)	77 (32·3)	21 (8·8)	12 (5·0)	1 (0·4)	238

Very severe case with scalp abscess.

Recurrence

No recurrence took place in any case during the period of stay in hospital nor has any patient been readmitted with a recurrence one month after the closing of the records This is rather a remarkable result In our first series of 312 cases there were twenty seven cases of recurrence an incidence of 8 65 per cent In our second series of 270 cases the percentage incidence was 3 7 As half the cases in the two preceding series were not treated with any preparation of sulphanilamide and as all cases in this third series received some form of sulphanilamide the absence of recurrence may be adduced as a further strong argument in favour of treatment by some form of sulphanilamide

Complications

Here are included the septic complications directly attributable to infection with erysipelas Among such conditions are abscess formation septicaemia, thrombosis and nephritis

The percentage incidence was 13 8 in those cases receiving sulphamido-chrysoidine 6 6 in the cases receiving sulphanilamide and 13 8 in the cases treated with benzylsulphanilamide The number of complicated cases is so small that no significance is attached to the slight differences in the three percentages

Deaths

The number of deaths was five out of 242 a percentage of 2 06 This is low if compared with the annual fatality rate given for Ruchill Hospital in the medical officer of health's annual returns The percentages there for the past few years are 1935 7 5 1934 7 6 1933 9 3 1932 9 6 1931 7 7 Four of the patients who died have been excluded from Tables I II and III for obvious reasons but one is included because the erysipelas was completely cured and the patient a male aged 72 who suffered from chronic myocarditis collapsed and died on being allowed up on the ninth day after admission to hospital In this case the duration of spread of the lesion was two days of primary pyrexia three days and of toxaemia four days The data relevant to these fatal cases are given in Table IV

TABLE IV—*Details of Fatal Cases*

Case No	Method of Treatment	Sex and Age	Site	Days Ill before Admission	Dose of Drug in Grms.	Duration of Treatment in Days	Days in Hospital	Remarks
531	Sulphamido-chrysoidine	M 75	Facial	2	6	1	1	Large rodent ulcer of face Acute nephritis on admission Developed cavernous sinus thrombosis
1,114	Sulphamido-chrysoidine	F 43		2	24	2	2	Carbuncle of neck Diabetes mellitus Died in coma
*716	Sulphanilamide	M 72	"	1	11	3·5	9	Chronic myocarditis Allowed up on ninth day in hospital—collapsed and died
95	Benzylsulphanilamide	M 64		3	36	3	8	Lesion had subsided at death Chronic drinker of methylated spirit. ? due to cerebral atheroma Post mortem refused
6011	Benzylsulphanilamide	F 77	Leg	10	30	5	45	Developed subcutaneous abscesses of legs which would not heal. Senile hypostatic pneumonia terminal event

This patient was completely cured at time of death, and death had no relation to erysipelas

It is to be noted from Table IV that none of these deaths occurred in uncomplicated cases of erysipelas It is quite apparent that no definite conclusions can be drawn from fatality rates in this disease as to the relative merits of different types of treatment since there will always be a proportion of patients suffering from associated disease in whom erysipelas is merely one of the terminal events

Toxicity

Table V gives the total observed incidence of toxic manifestations

TABLE V—*Toxic Effects*

Type of Toxic Reaction	Sulphamido chrysoidine		Sulphanilamide				Benzylsulphanilamide	
	1 gm.	2 gm	0·5 gm	0·75 gm	1 gm.	2 gm	1 gm.	2 gm.
Moderate cyanosis	–	–	–	–	1	6	–	–
Slight cyanosis	7	2	14	12	13	13	2	3

Delirium	1	1	–	1	–	–	–	–
Jaundice (?)	–	–	–	–	1	–	–	–
Complaint of severe drowsiness	–	–	–	1	–	1	–	–
Total cases showing toxic effects	10 (33·3)	6 (21·7)	16 (53·3)	17 (56·8)	17 (56·8)	25 (80·1)	5 (17·2)	5 (17·2)

* This case left hospital against advice on day jaundice was noted—twelfth day

The occurrence of some degree of cyanosis was the most commonly observed toxic effect Irrespective of drug or dosage, the total incidence was 30 7 per cent In no case could the appearance of cyanosis be considered dramatic, it was never of long duration and there was little constitutional disturbance No spectroscopic examinations were made, but none of the cases exhibited the severe degree of cyanosis that had been previously noted by us in patients with proved sulphaemoglobinaemia No patient received any form of sulphur while under treatment Twenty-nine per cent of the patients, however, gave a history of taking 'salts' before admission to hospital The routine which is adopted in the hospital when such a history is obtained is to administer a soap and-water enema on admission, repeat it in twelve hours, and delay treatment with the drugs until after the second enema Cyanosis developed in 32 8 per cent of those who gave a history of taking 'salts," while in those who had no such antecedent history the incidence of cyanosis was 29 per cent It has been suggested that there is a causal relation between premedication with saline purgatives containing sulphur and the occurrence of cyanosis (Paton and Eaton, 1937, Discombe, 1937) The close equivalence of the percentages in the two groups in this series and the absence of severe cyanosis rather suggests that the enemata may have some preventive action on the occurrence of cyanosis

At no time did cyanosis give cause for alarm, and while in some cases the drug was stopped on its appearance, in the majority the drug was continued with no apparent ill effect When comparison is made between the drugs used, it is found that the incidence of cyanosis was less in those cases which received sulphamido-chrysoidine or benzylsulphanilamide, and that, as we had previously suggested, cyanosis increased in incidence with the larger doses of sulphanilamide

Toxic effects other than cyanosis were noted in 11 8 per cent of the cases These (see Table V) were transient in nature, rapidly ceased after stoppage of the drug, and did not give rise to prolonged illness or unpleasant sequelae The occurrence of these secondary toxic effects cannot be correlated with any particular type of drug used, and whether they are an expression of idiosyncrasy or of some factor still undetected cannot yet be stated While routine blood examinations have not been carried out, no case has been observed in which there was any clinical suggestion of blood dyscrasia

One further observation should be made regarding toxic effects Reference to Table II shows that when 1 gramme of sulphanilamide was given four-hourly only 3 2 per cent of cases remained pyrexial after three days in hospital, while with a dosage of 2 grammes four-hourly the equivalent percentage was 25 8 When the other criteria of cure are examined in these two groups it is seen that if 2 grammes of sulphanilamide are given four-hourly the duration of the spread of the lesion and of toxaemia closely corresponds to the results obtained with 1 gramme of sulphanilamide given at four hourly intervals If this is taken in association with the later occurrence of drug fever as a toxic sign it would seem that larger doses of sulphanilamide may have a direct effect in the prolongation of fever

Discussion

Table VI summarizes the results obtained with the different drugs used in the combined series irrespective of dosage employed Percentages only are given

TABLE VI

Drug Employed	No Spread after 24 Hours in Hospital	No Pyrexia after 48 Hours in Hospital	No Toxaemia after 3 Days in Hospital	Toxic Effect of Drug	No of Cases
Sulphamido-chrysoidine	86 2	77 6	65 5	27 5	58
Sulphanilamide	68 3	72 1	59 0	61 4	122
Benzylsulphanilamide	68 9	74 1	29 3	17 2	58

It would appear that in respect of its effect on the duration of spread and toxaemia the action of benzyl sulphanilamide is slower than that of either of the other drugs The incidence of toxic effects from this drug is the lowest, but on the other hand, as has been stated earlier, the occurrence of these toxic phenomena seems to have no harmful sequelae, provided that the drugs are used in proper dosage and under careful clinical supervision On these grounds, therefore, and after careful study of Tables I, II, and III, we feel that benzyl sulphanilamide is not the drug of choice in the treatment of erysipelas

The figures in Table VI indicate that there is little to choose between sulphamido-chrysoidine and sulphanilamide I Table VI, however, the varied dosage of the two drugs employed is not taken into account One of the purposes of this paper is to attempt to ascertain a dosage which will have the optimal clinical effect After careful scrutiny of Tables I, II, and III it is thought that the best results have been obtained with the employment of sulphamido-chrysoidine in 1 and 2 gramme doses and sulphanilamide in 0 75 and 1 gramme doses The effects of these are summarized, therefore, in Table VII, using the same criteria for assessment and again expressing the results as percentages

TABLE VII

Drug and Dosage Employed	No Spread after 24 Hours Treatment	No Pyrexia after 48 Hours Treatment	No Toxaemia after 3 Days Treatment	Toxic Effects of Drug	No of Cases in Group
Sulphamido chrysoidine 1 gramme	80	86 7	66 7	33 3	30
2 grammes	92 9	67 9	66 7	21 7	28
Sulphanilamide 0 75 gramme	86 7	73 3	65 5	54 8	0
1 gramme	90 3	67 7	58 1	54 8	30

Analysis of Table VII suggests the following conclusions

(*a*) *Duration of Spread*—The percentage differences are small and not statistically significant The fact that with each drug better percentage results are obtained when the larger doses are employed is, however, suggestive of increased therapeutic effect

(*b*) *Duration of Primary Pyrexia*—We again note a slight lag in the fall of temperature when the larger doses are employed As already stated, we feel that the drugs may have a direct pyrexial effect in the larger quantities

(*c*) *Duration of Toxaemia*—No difference is observed between the two drugs or their varied dosage

(*d*) *Toxic Effects*—The occurrence of toxic effects is slightly less when sulphamido chrysoidine is used

(*e*) *Dosage*—The percentages indicate that the therapeutic results obtained with a dosage of 2 grammes of sulphamido-chrysoidine and 1 gramme of sulphanilamide

closely correspond In other words the sulphanilamide radical weight for weight is clinically more effective than the original sulphamido chrysoidine

We are however of the opinion from the above figures that the choice of drug to be employed can be left to individual preference The method of administration to an adult patient should be (i) Sulphamidochrysoidine 1 5 grammes every four hours—that is 9 grammes a day—until cure is established thereafter 1 gramme three times daily for a further period of fourteen days (ii) Sulphanilamide 1 gramme every four hours —that is 6 grammes a day—until cure is established thereafter 1 gramme three times daily for a further period of fourteen days

All other drugs must be avoided during the period of specific treatment a list of suitable purgatives should be given to the patient the use of enemata explained and explicit instructions given regarding diet along the lines laid down in our previous paper (Snodgrass and Anderson 1937b) Toxic effects should be reduced to a minimum if these suggestions are followed

We wish to thank Dr W M Elliott physician superintendent of Ruchill Fever Hospital for permission to conduct the investigation We would also record our thanks to Mr Victor Goode registrar for careful assistance in the collection of the figures

LATE RESULTS OF SURGICAL TREATMENT IN PERFORATED PEPTIC ULCER

BY

J VERNEY CABLE, M D, M R C P
Formerly Resident Medical Officer to the Wellington Hospital New Zealand

Upon the late results of surgical treatment in cases of perforated peptic ulcer there appears to be a considerable diversity of opinion Thus Thompson Miles and Wilkie (1931) state that the successful closure of a perforation is in many cases followed by freedom from digestive trouble though they add that this is not so in a number of cases Sherren (1932) considers that if the ulcer which perforates is acute and situated on the anterior surface of the stomach no further symptoms will develop in most cases Walton (1934) commenting on the different views held says that a close follow up does not confirm the opinion that the majority of cases have no further symptoms after recovery from operation Romanis and Mitchiner (1937) consider that successful recovery from a perforation is nearly always followed by a period of relief from symptoms that may last from six to eighteen months before the recurrence which they seem to regard as a common event

The present investigation was carried out at the Wellington Hospital New Zealand with a view to ascertaining the late results of simple closure of a perforated peptic ulcer No attempt was made to divide the cases into groups in which the ulcer was thought to be acute or chronic The findings are compared with the results obtained from the treatment of a group of cases of unperforated peptic ulceration by medical methods

There were forty one cases of perforated peptic ulcer treated by simple closure this figure comprising fourteen cases of gastric ulcer twenty five cases of duodenal ulcer and one case each of jejunal and gastro jejunal ulceration The time elapsing between the occurrence of perforation and operation varied considerably being in some cases as short as one hour and in others as long as two days That the period was often longer than is usually the case in Great Britain is due in large measure to geographical considerations and lack of transport facilities and is reflected in the high mortality for of the forty one patients submitted to operation twelve died The site of the ulcer in the latter was duodenal in eight cases gastric in three and jejunal in one case

A careful follow up was made at a period after the operation varying from six months to three and a half years Of the twenty nine surviving patients five were not traced leaving twenty-four cases to be assessed The cases were divided into four groups according to their condition at this examination (1) Classed excellent the patient can eat anything without symptoms (2) Classed good the patient remains free from symptoms while keeping to some dietary restrictions (3) Classed fair symptoms troublesome even on dietary restrictions but have not obliged the patient to lie up or to stop work (4) Classed poor where the symptoms have required further treatment or have prevented the patient from working The results according to this classification are shown in Table I

TABLE I

	No of Cases	Percentage of Cases Treated
Excellent	2	8
Good	6	25
Fair	6	25
Poor	10	42

Of the ten cases classed as poor four have required surgical treatment from which two patients died while two others have since died from gross haemorrhage Two more have been readmitted to hospital one of these was found to have some pyloric stenosis and would have received surgical treatment had he not been considered too poor a risk on account of his age and general health Thus of the forty one patients admitted for treatment of a perforated ulcer sixteen (39 per cent) are known to have died as a direct result of the ulcer while six others (15 per cent) are in a state of chronic invalidism, and only eight cases (19 5 per cent) could be grouped together as good or excellent results

Comparison with Medical Treatment

These results may be compared with those obtained from treating a group of cases of peptic ulcer medically The diagnosis in this group was made clinically and was confirmed from radiographs a definite crater being the criterion

The mode of treatment was the usual dietary restriction and alkaline powders with rest in bed for a minimum of three weeks This treatment was carried out thoroughly for approximately three weeks in hospital, but at the end of that time in some cases the later treatment was not so strict as is now the rule It was considered that this lack of strictness was the principal reason for the somewhat unsatisfactory results of medical treatment, and consequently a prolonged and thorough regimen as advo-

cated by Hurst (1937) has since been more generally adopted

A group of eighty-one treated patients were traced and their condition assessed by the classification given above There were twenty-three cases of gastric ulcer and fifty eight of duodenal ulcer The results are set out in Table II

TABLE II—*Cases of Gastric and Duodenal Ulcer treated Medically*

	Gastric Ulcer		Duodenal Ulcer	
	No of Cases	Per cent	No of Cases	Per cent
Excellent	3	13	7	12
Good	7	30	24	41
Fair	4	17	12	21
Poor	9	39	15	26

Taking the gastric and duodenal cases together, the total number classed excellent is ten (12 per cent), while the number classed good is thirty-one (38 per cent), and if these cases are included in one group, "Excellent-Good," there are forty-one (50 per cent), a figure distinctly better than the comparable one in the perforated group Though the present series of cases is admittedly small, they were followed up carefully, and it is felt that the findings are of some value They lend no support to the view that cases of perforated peptic ulcer usually recover from their original disability after closure of the perforation

Summary

The late results of surgical treatment in a series of cases of perforated peptic ulcer are reviewed and compared with the late results of treatment in a group of cases of peptic ulceration treated by medical methods

It is shown that in the present series the results are opposed to the view that a considerable proportion of cases of perforated ulcer are free from ulcer symptoms after surgical closure

A new periodical, the *Journal of Neurophysiology*, has been founded to provide a channel for the early publication of original work bearing on the functions of the nervous system It will not include articles on morphology or on neuropathology but only those clinical, psychological or zoological contributions which are regarded as being primarily experimental in character In a memorandum on the policy of the journal issued by the editors it is suggested that neurophysiology has now reached a stage at which it may well claim recognition independently of the parent science of physiology Although they state one may deplore the increasing subdivision of physiology this fragmentation is to a large extent inevitable The Editorial Board consists of Drs J G Dusser de Barenne J F Fulton and R W Gerard, who are supported by distinguished advisers in various parts of the world The *Journal of Neurophysiology* is to be issued every two months at a subscription rate of 6 50 dollars for countries outside the U S A Canada, and Latin America, and is published by Charles C Thomas, Springfield, Illinois

Clinical Memoranda

Recovery from Haemolytic Streptococcal Septicaemia in Patient with Diabetes

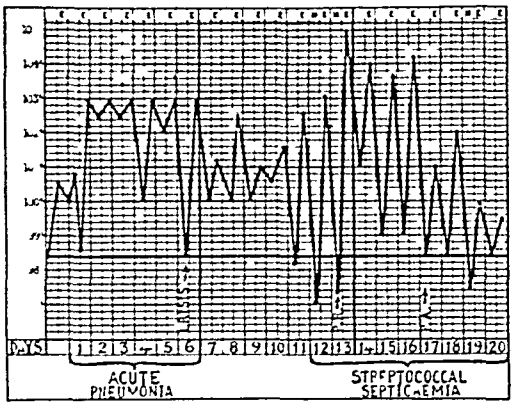
The following case of streptococcal septicaemia treated with prontosil seems interesting enough to be placed on record

CASE RECORD

A woman aged 29 had been treated for diabetes mellitus for several years She had been stabilized satisfactorily on a Lawrence diet, receiving 12 black and 8 low red lines She required insulin 25 units in the morning and 20 units in the afternoon

Until the onset of her illness she had been keeping perfectly well Her first symptoms were general weakness, aching in the limbs, dyspepsia, and pyrexia, being attributed to a mild attack of influenza At this stage she was admitted to the Royal Infirmary of Leicester The influenza pursued a normal course, although of a severe form, until five days after admission, when she complained of pain in the right side of the chest on deep inspiration On auscultation pleural friction rub was found Next day there was evidence of consolidation in the right upper and middle lobes Type II pneumococci were found in the sputum On the third day 25 c cm of Type II anti pneumococcal serum were given intravenously The pneumonia pursued a normal course until the fifth day, when an apparent crisis occurred However on the same evening the temperature rose again to 103° F Three days after the crisis an acute otitis media developed in the right ear, which rapidly settled after two days

Ever since the pseudo crisis the temperature had continued to fluctuate between 100° F and 103 F, never falling to normal pleural effusion was suspected On aspiration 4 ounces of clear fluid were obtained This was found to contain large quantities of haemolytic streptococci Blood examination showed 22,108 white cells per c mm, 88 per cent being polymorphs Six days after the pseudo crisis the spleen was first palpable, leading one to suspect blood stream infection, and about the same time the temperature began to rise in a manner suggestive of septicaemia On blood culture haemolytic streptococci were found in all the tubes after sixteen hours incubation



Up till this time the patient's general condition had been fairly satisfactory, although her diabetes was difficult to control but once the septicaemia developed the gravity of her illness became apparent She was exhausted, and dyspnoeic on the slightest movement, and the diabetes was uncontrollable even with very large quantities of insulin

Prontosil rubrum was now given intramuscularly, 10 c cm daily for four days This was followed by prontosil album (orally), 12 tablets daily Six days after the commencement of the septicaemia another blood culture was taken It was sterile after sixteen hours incubation Haemolytic streptococci were found in two tubes after three days Blood examination showed a fall in the white cells to 14,374 per c mm, of which 85 per cent were polymorphs The general condition of the patient also showed marked improvement, exhaustion being much less evident However, the temperature continued to fluctuate for a further three days although in a less alarming manner than previously

Ten days after the temperature had ceased to swing administration of the prontosil was stopped The temperature immediately began to show signs of a return to the septicaemic type, rising at nights to 102 F The administration of 6 grammes of prontosil daily was at once recommenced, and after three more days the temperature began to settle again This time

the prontosil was continued for a further two weeks gradually being reduced every three days thereafter

Since that date progress has been satisfactory except that the resolution of the consolidated lung has been slow Ultra therm treatment has been instituted resulting in hastening of the resolution A blood examination immediately after the

Daily Temperature Chart P R = Prontosil rubrum P A = Prontosil album

cessation of the prontosil showed white cells 10 100 per c mm red cells 4 650 000 per c mm haemoglobin 88 per cent these last two figures being higher than those taken a year previously while in good health The total dosage of prontosil rubrum was 40 c cm intramuscularly and that of prontosil album 136 tablets (orally)

SUMMARY

The above record describes the case of a patient suffering from diabetes mellitus who developed lobar pneumonia and otitis media followed by proved haemolytic streptococcal septicaemia Prontosil was given in large doses with recovery of the patient Chief points of interest are

Statistics state that the fatality percentage in streptococcal infections secondary to diabetes mellitus is 90 In such a case as described above the mortality rate would be still higher Considerable improvement, both clinical and bacteriological was noticed after administration of prontosil was begun with immediate relapse after its cessation this suggests that prontosil was responsible for keeping the septicaemia in abeyance, having not yet finally destroyed it

No ill effects were discovered after giving very large and intensive doses of prontosil There was no suggestion of agranulocytosis However there has been a tendency to persistence of slight ketosis which was not present before the illness This may be a symptom of the toxic action of prontosil

The evidence produced in this case still further corroborates previous opinion as to the specific action of prontosil upon haemolytic streptococci

I am much indebted to Dr R McD Cairns for permission to report on this case

Reviews

ENCYCLOPAEDIA OF MEDICAL PRACTICE

The British Encyclopaedia of Medical Practice including Medicine Surgery Obstetrics Gynaecology and Other Special Subjects Volume VII Under the General Editorship of Sir Humphry Rolleston Bt G C V O K C B M D D C L LL D (Pp 718 16 plates including 1 coloured plate 171 figures London Butterworth and Company 1938

The issue of the successive volumes of the new encyclopaedia occurs with commendable regularity Volume VII covers the subjects hyperchlorhydria to leucorrhoea and of the seven hundred pages one quarter is devoted to the problems of labour The reader will find a full account of the mechanism and conduct of normal labour and the various causes of delay through ineffective uterine contractions malpositions disproportionate size of uterine contents or the bony pelvis clearly and succinctly described by experts in the subject Professor O Donel Browne deals with the operative and manipulative procedures which may be needed in complicated cases and there is a useful section on anaesthesia and analgesia in normal and difficult labour Radiology may be found an adjuvant to other methods of diagnosis and a statement of the principles involved concludes the group of articles Professor James Young who is responsible for the editorship of this section is to be congratulated on the successful choice of his contributors The whole forms a good description of modern obstetrical practice and like all the articles in the encyclopaedia is clearly headed so that ready reference may be made to the particular point required Professor Amy Fleming completes the gynaecological articles of this volume with a statement of the causes and treatment of non haemorrhagic vaginal discharges Proper differentiation must be made to ensure success in treatment

The principles of feeding normal infants by breast feeding wet nursing or by means of artificial foods and the dieting of children of older years are discussed by Dr Kenneth Tallerman Mr Lionel Colledge deals with the diseases of the larynx giving clinical pictures of the acute and chronic disorders met with their diagnosis and treatment He adds a lucid description of the operative procedures which may be used their indications and technique Mr A E Roche deals with the surgical diseases of the kidney while the important subject of acute and chronic intestinal obstruction is taken by Mr Nils L Eckhoff The symptoms arise apparently from chemical change in the stagnant intestinal contents behind the obstruction and perhaps even more from the changes in the blood supply of the bowel wall bringing about necrosis A state of collapse rapidly supervenes and even with modern surgical progress the mortality is great—in acute intestinal obstruction rarely below 30 per cent The formidable condition of post operative ileus may usually be prevented by pre operative preparation and careful operative technique Differentiation of ileus of sympathetic origin from that caused by obstruction may be made by giving spinal anaesthesia but this must be done when immediate operation is available to follow failure to relieve Diseases and disorders of joints and their development from injury are dealt with by Mr George Perkins and Professor G R Girdlestone Among the medical subjects the factors involved in jaundice are stated by Professor McNee from the modern aspect which he himself has done much to make clear The colour

giving rise to the symptoms is due to the formation of bilirubin largely outside the liver, jaundice then may be due to excessive production of bilirubin swamping the blood or to the obstruction in its excretion through the liver whether by blocking of the small or large bile ducts or by changes in the liver cells themselves The implications of the van den Bergh reactions are set out

Other syndromes in this volume are insomnia, by Dr J P Martin, and hyperchlorhydria, by Professor Henry Moore, while Dr Gladys Wauchope gives a satisfying description of the phenomena of hyperglycaemia and hyperinsulinism and their treatment Dr Douthwaite's article on influenza covers the vexed questions of the infecting agent (which is almost certainly a virus) and the secondary infecting bacteria which are responsible for so many of the complications, the diagnosis, and the treatment, for which there is no specific as yet Leishmaniasis and leprosy are important specialist subjects Of other special articles in this volume, Dr Strauss discusses hypnotism, Dr Okell immunity and immunization, and Dr J C Bridge lead poisoning Dr Otto May's comments on the points to be taken account of by examiners for life assurance will be useful to practitioners who undertake much of this work, and the interesting and important subject of industrial accidents is approached from the general and legal aspects by Dr D C Norris, who includes the factors of causation, so often in the worker himself, prevention, and estimation of compensation for disability sustained

RESPONSIBILITY UNDER SUPERVISION

Internships and Residencies in New York City 1934–1937 Their Place in Medical Education Report by the New York Committee on the Study of Hospital Internships and Residencies Jean Alonzo Curran, M D (Pp 492 tables 10s 6d net) New York The Commonwealth Fund, London Oxford University Press 1938

In our issue of March 19 last (p 628) we noticed a booklet on *Intern Education and Supervision* issued under the auspices of the Canadian Medical Association It was a succinct and valuable report on internship in relation both to medical education and to hospital administration and practice We now have a somewhat weighty volume entitled *Internships and Residencies in New York City, 1934–1937* It is thoroughly and characteristically American It has been compiled by a committee and subcommittees of no fewer than fifty-nine medical men with the help of several other persons, men and women, medical and lay, whose services are acknowledged in a preface It contains just under 500 pages, including nine appendices and nineteen statistical tables which may interest the curious and are more or less illuminating The information given and the opinions expressed are mainly the result of questionaries addressed to a large number of ex-interns and ex-residents and to the staffs of New York hospitals The general outcome of all this laborious, systematic, and careful activity does not seem to be more valuable than that embodied in the much more modest report published in Canada Indeed the conclusions arrived at, though confirming so far as they go those of that report, are less wide in character and less applicable to this country, but they are supported by much more detail

Some of these details seem to be of small importance, but others are in themselves interesting and significant For instance, while the trend from general to special practice in America is well marked, over half the specialists of each type have had a period of experience in general practice of an average duration of four or five years Only a little over half of all graduates practise obstetrics, either as specialists or with their other work, and the proportion seems to be becoming smaller It was found that 40 per cent of those in practice were doing major surgery, 58 per cent had made no attempt to enter this field, while only 2 per cent had done so temporarily before abandoning it If these facts can be taken as indicating the community need it would appear that not more than half the interns require "drill in major operation technique," and only a slightly larger proportion require drill in obstetric technique A good deal of intern education and experience is held to be misdirected It is regarded as axiomatic, however, that every student, after qualifying, should have at least one year, preferably two years, as an intern in one or more departments of the hospital, and that if a specialty is to be adopted two years' internship should be followed by "residency" of similar duration in the particular department required This being so it is essential that the undergraduate curriculum should be adapted to this programme, and that the period of internship should be so organized and conducted as to constitute a direct and effective preparation for practice In fact, in a large proportion of cases neither of these requirements is fulfilled The primary and essential function of resident posts in hospitals is educational "While they serve a useful purpose in the care of the sick in a modern highly organized hospital, it is only by this practical supervised experience that the student doctor can be qualified to assume independent responsibility for the care of patients"

That by some means, whether in hospital or otherwise, a reasonable period of actual responsibility under supervision must be a compulsory part of medical education is the conclusion arrived at by every inquiry into this subject, whether in America, in Canada, or in England

UROLOGICAL PRACTICE

The Practice of Urology By Leon Herman, B S, M D (Pp 923, 504 figures, 4 plates with 3 in colour 45s net) Philadelphia and London W B Saunders Company 1938

This admirable book well fulfils the author's ambition of writing a practical treatise on diseases of the urogenital system While intended particularly for the use of the general practitioner and surgeon, this volume will be of especial value to the urologist, written as it is from clinical experience and packed with valuable hints and "tips" The legends accompanying the numerous and excellently produced illustrations are a urological education in themselves Both author and publishers are to be congratulated on this fine production, which will surely take its place as a leading standard work on urology for many years to come The type is large and clear, but, as is often the case with similar works, the book is heavy to hold

The work is divided into various parts—on diagnosis (cystoscopy, urethroscopy, urography), instrumental therapeutics in urology (for example, operative cystoscopy), the kidney (with a chapter on renal physiology, tests of renal function, and renal sympathectomy), the ureter, the bladder (including its physiology and functional disorders), the urethra (with many chapters on gonorrhoea and its complications), the penis and scrotum, the testicle, spermatic cord, and seminal vesicle (including a chapter on functional disorders of the male sexual system), the prostate gland, urolithiasis, urogenital tuberculosis and actinomycosis, and urinary syphilis One may regret the use of the often encountered but etymologically unsatisfactory word "urinalysis" In contradistinction to the high proportion of cases of ureteric calculus operated upon

in some clinics conservative surgeons will agree with the author's estimate that operation is required in approximately 10 per cent of such cases In his opinion ureteric meatotomy should if possible be avoided because serious damage to the upper urinary tract in the form of permanent reflux may result A pyelogram of such a case is given showing uretero renal *dilatation* It would be interesting to know how often this occurs after properly performed meatotomy If not often as is probable such a possible complication should not prevent the use of a valuable therapeutic measure when truly indicated especially as open operation may be thus avoided The author's conclusion that tuberculin therapy though of value as an accessory measure in genital tuberculosis is useless and sometimes harmful in renal tuberculosis must like all his statements command respect and is probably correct

Altogether this is one of the best books on urology one could wish for The author has gone less to other books than to Nature for his knowledge with the result that his work is a mine of practical urological wisdom

VETERINARY PARASITOLOGY

A Guide to Veterinary Parasitology for Veterinary Students and Practitioners By T Southwell D Sc Ph D and A Kirshner M B Ch B D T M (Pp 143 88 illustrations 12 diagrams 7s 6d net) London H K Lewis and Co

For some twenty years Dr Southwell of the Liverpool School of Tropical Medicine has been teaching parasitology to the veterinary students of the University of Liverpool He and his assistant lecturer have produced their course of lectures in a condensed form as a book in which they have endeavoured to present veterinary parasitology in as simple elementary and practical a manner as possible Those who are familiar with Dr Southwell's power of simplifying the anatomy and differential diagnosis of parasites will need no assurance of the quality of this aspect of the work Illustrated by eighty-eight drawings and twelve diagrams it is an admirable students guide to the morphology of the more common protozoa, cestodes trematodes and nematodes of the horses cattle sheep pigs dogs cats and poultry farmed in Great Britain

In their preface the authors acknowledge that we have rather reluctantly included very brief accounts of the pathogenicity of some of the more important parasites The critic is disarmed by such charming confession of inexperience with the problem confronting the veterinary surgeon and he sympathizes with the authors in the loss of their former distinguished colleague Had the late Noel Pillers been spared to collaborate in this little book the authors intention of providing the practising veterinary surgeon with a useful guide might have been realized

ANAGLYPHS FOR SQUINTERS

Anaglyphs Their Use in Orthoptic Training By Margaret Dobson M D Lond (Pp 41 11 figures 11 photographic anaglyphs and 2 training anaglyphs 21s net) London C Tinsley and Co

We all learned something of the arrangement of the stereoscope during our First M B course in physics We remember that there were two pictures taken from slightly different angles, which when viewed through suitable prisms gave a wonderful sense of solidity to the picture The same effect can be obtained by printing two pictures of the same view in different colours—say red and blue—so that the two pictures do not accurately register upon each other The pictures when printed look like very bad two colour prints of some advertisement But when these prints are viewed through coloured glass or gelatin with red before one eye and blue before the other then there is gained by the visual centres of the observer as perfect an impression of solidity as the stereoscope can give This arrangement has been made use of by Dr Margaret Dobson for the production of a book of anaglyphs for use in the training of squinters A number of pictures and diagrams are provided with cardboard spectacles fitted with coloured gelatin for use in viewing the pictures The choice of pictures is good though for children we should have thought that a much simpler variety would have been more readily appreciated

The use of the anaglyphs is an alternative to that of the stereoscope and the adaptation of the stereoscope known as Worth's amblyoscope and other more complicated instruments There is room for a variety of apparatus

ANALYSIS OF DREAMS

Dream Analysis A Practical Handbook for Psycho Analysis By Ella Freeman Sharpe The International Psycho Analytical Library No 29 Edited by Ernest Jones (Pp 211 10s 6d net) London The Hogarth Press The Institute of Psychology 1937

This book is founded on lectures given in the training college for psycho analysis The method of production and mechanism of the dream is described in accordance with Freud's teaching and compared with certain recognized figures of speech in poetry Examples of dreams as they occur in psycho analytic practice are given and their significance and interpretation are discussed Others illustrative of differing types of dream are described showing to the author's satisfaction that however much they differ in accordance with the patient's type of personality they all refer to much the same themes in the depths of the unconscious—themes of infantile jealousies fears and hates due to sexual or excretory experiences or fantasies A single dream is analysed fairly fully as an example and certain problems in dream analysis are dealt with

The author shows how certain physical and psychical crises in life may determine dreams and how other dreams may show the stage of psychical readjustment reached in the course of analysis A few dreams from people who have finished their analysis are described and it is claimed that these do not markedly differ from those of the unanalysed but that the dreamer easily recognizes their meaning and does not suffer from any anxiety or painful feeling tone in relation to them Finally the last dream of a patient's life is narrated with a few moral reflections upon it

There is nothing strikingly original in this book and it is not likely to be of much interest except to those who are serious students of psycho analysis

Notes on Books

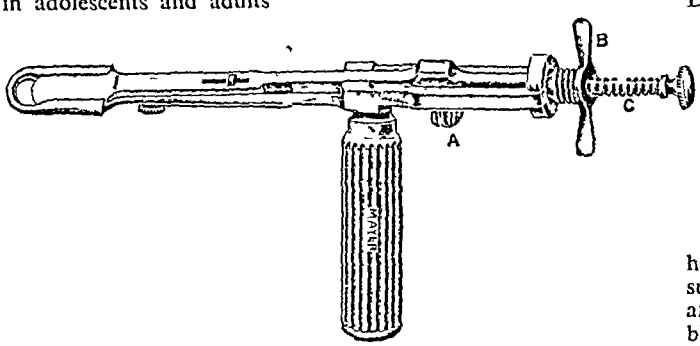
The eighteenth edition of *Dorland's Medical Dictionary* (W B Saunders Company 1938 30s plain 32s 6d with thumb index) has been brought up to date by thorough revision and the addition of more than 3 000 words This valuable work of reference now extends to over 1 600 pages and on almost every page new terms and improved definitions will be found For every term the pronunciation is given phonetically followed by the derivation and a concise definition The largest amount of new and revised definitions will be found in the fields of endocrinology immunology pathology medical

chemistry, clinical medicine, and dentistry In his preface Dr Newman Dorland acknowledges help from a host of friends of the Dictionary, with special mention of the editorial staff of the American Medical Association for their splendid co-operation From the same publishers comes the sixteenth edition of Dorland's *American Pocket Medical Dictionary* (price 8s 6d plain, 10s 6d with thumb index) For its size this is a remarkably comprehensive work, giving brief definitions of over 50,000 technical terms The whole material has once again been overhauled to keep pace with the advances in medicine and the allied sciences and the growth of their terminology The latest Pocket Dorland should prove even more useful than its predecessors

The Cockroach Its Life-History and How to Deal With It Pamphlet No 12 in the Economic Series, printed by the British Museum (Natural History) has now appeared in a third edition All who are plagued by these pests must feel grateful to Mr FREDERICK LAING for his practical booklet It may be obtained from the Natural History Museum, Cromwell Road, London, S W 7, at 6d (postage 1d)

L'Expertise en Stomatologie by M DECHAUME and L DEROBERT with a preface by Professor Balthazard, is published in Paris by Masson et Cie, 1937, at 30 fr Its title may be freely translated as "The Stomatologist and the Law' The authors have made a detailed study of the function of the stomatologist in criminal and civil cases Each year a list of experts is drawn up by the appropriate tribunal, and only a doctor of medicine can act in criminal cases Perhaps for this reason the elements of dental anatomy are included The book will be found extremely interesting by medico-legal experts, especially we note that the expert must approach his task free from bias, and that his evidence is given to the court for the guidance of the presiding judge

A handy *Dictionary of Scientific Terms* has been compiled by Surgeon Rear-Admiral C M BEADNELL (London, Watts and Co, 5s net, cheap edition, 1s net) It serves the purpose of a small reference book rather than a dictionary, and will be of interest to students and to those desirous of learning something about recent advances in scientific matters There are numerous cross references, synonyms, and antonyms, and a bibliography, for the further pursuit of the various subjects, is given at the end of the book



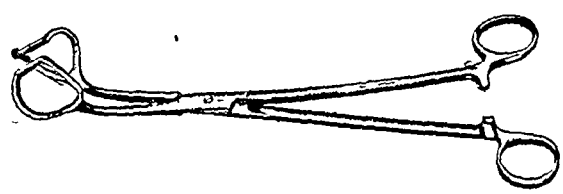
Another popular work from the pen of PAUL DE KRUIF entitled *The Fight for Life* (London Jonathan Cape, 12s 6d) concerns itself with the "war" against puerperal fever, tuberculosis, poliomyelitis, and syphilis, and its high lights are chemotherapy and electric fever The publisher's note credits the author with being able to "dramatize" such matters, and make them "not only comprehensible but vivid" Of this there is no doubt, but the process of dramatization has perhaps gone rather far for English taste There is a huge public for such works as this in America, where they like to know all about their diseases, and a flamboyant emotional style is more acceptable than some of us find it The first requisite in a book of this kind is scientific truthfulness, and this author's popular works are commendable from that point of view

Preparations and Appliances

A HAEMOSTATIC TONSIL GUILLOTINE

Mr E CRAIG DUNLOP F R C S Ed (Carlisle), writes

This instrument is intended for use in the enucleation of such septic tonsils as are suitable for the guillotine operation in adolescents and adults



The method employed is that of Whillis and Pybus The edge of the blade is rounded on section, and when fully home meets a *flat* metal surface in the end of the guard ring The blade is closed over the tonsil by pressure on the thumb piece A in the usual way the peritonsillar tissues being grasped tightly enough to enable the tonsil to be dislocated Then, by turning the screw B the blade is gradually driven home, thus crushing the pedicle The spring C ensures that the thread of the screw is ready to engage immediately B is turned After leaving the instrument in position for five or six minutes severance of the tonsil is completed by screwing the rounded edge of the blade hard up against its flat opposing surface in the guard ring

The advantages claimed for this instrument are its simplicity and that it leaves a minimum of crushed tissue in the tonsil bed The guillotine has been made for me by Messrs Maxer and Phelps New Cavendish Street London, W 1 to whom I owe my thanks

GALL-BLADDER FORCEPS

Mr T B MOUAT F R C S, honorary surgeon to the Sheffield Royal Infirmary, writes

The special gall bladder forceps made for me by Messrs Down Bros, Ltd, and shown in the accompanying figure,

have proved useful There are at present no forceps quite suitable for pulling up the neck of the gall bladder Even after aspiration of the fluid contents of a distended gall bladder the inflamed and thickened wall may tear through if it is grasped by cholecystectomy or artery forceps, while tissue forceps or triangular forceps are apt to crush the contents or pull off

The blades of the special forceps are sufficiently bowed to leave room for the gall-bladder even when its neck contains stones, and their finely serrated half inch wide jaws give a firm grasp which enables the surgeon to pull up the neck of the gall bladder without danger of tearing the structures and give good exposure for the dissection of the cystic duct and artery before cholecystectomy

CALCYDIC TABLETS

Calcydic tablets (Allen & Hanburys Ltd) contain dicalcium phosphate and vitamin D made up with chocolate flavoured glucose They thus provide calcium and phosphate, together with vitamin D to promote the absorption of the minerals

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY AUGUST 20 1938

NATIONAL HEALTH INSURANCE IN AUSTRALIA

As was indicated in a leading article in the *Journal* of July 2 the National Health and Pensions Insurance Bill which had been introduced in the House of Representatives of the Commonwealth of Australia was assented to on July 5 last, and so became an Act In its passage through Parliament it was not subjected to any substantial alteration but it may be noted that sickness benefit will now be payable from the fifth day of incapacity In the same article it was stated that the Australian Government had undertaken to appoint a Royal Commission to consider mainly the terms and conditions of service of medical practitioners accepting service under the provisions of the Act The personnel of this Commission is as follows Chief Justice Dethridge (Chief Judge of the Commonwealth Arbitration Court) as chairman Sir George Mason Allan (President of the Institute of Chartered Accountants Sydney) Dr R D Mulvey of Bathurst N S W (President of the Western Medical Association a local association in New South Wales) The appointment of a medical man as one of the three Commissioners is unusual and noteworthy there may however be divided opinion as to its appropriateness or wisdom The terms of reference of the Commission are elaborated under eight headings but the matters on which it is to advise the Government may be briefly summarized as three (1) the amount of the capitation fee for insurance practitioners and of mileage grants and the method of distributing these having regard to emergency treatment and to temporary residence (2) the circumstances and conditions under which insurance practitioners may require payments from insured persons in respect of services rendered in pursuance of their contract or of services outside that contract (3) the amount of payments which may be made by organizations to practitioners under contract on a voluntary basis for attendance on the wives and children of insured persons and the conditions under which practitioners who enter into such contracts may require payment for services outside their terms The Commissioners in determining all these matters are to have regard to " the terms and conditions of existing contract practice in Australia " as well as to other relevant considerations In the absence of any further explanation it is difficult to see how any legal validity can be attached to the third section of the reference as outlined above or indeed why this should have been made the subject of reference at all In any case the Prime Minister of Australia has announced that any findings or recommendations of the Commissioners will not be binding upon either the Government or the medical profession

To meet the situation that has thus arisen the Federal Council of the British Medical Association in Australia has set up a special committee consisting of the members of that Council together with a general practitioner from each Branch and with some power of co option The Federal Council will take no action without first consulting this committee which has already held a number of meetings and passed several rather drastic resolutions One of these seems to question the constitutional legality of the Government having introduced any such legislation for establishing medical benefit at all and even suggests that it may be feasible to apply to the High Court for an injunction against the Government on this matter Another resolution asks the Government to extend the terms of reference of the Royal Commission so that it may consider a general medical service for the nation and a capitation fee which instead of being uniform should be proportionate to the income of the insured person From this distance both these resolutions seem to be of doubtful wisdom or advantage and to be unlikely of success Would it not be better and more effective instead of trying to create an altogether different situation, to accept that which has now arisen and concentrate on presenting what is undoubtedly a very powerful case to meet it on behalf of the profession, before the Commission? It is unlikely that the Commonwealth Government has acted without the highest legal advice It would appear desirable that the status of the profession and the main conditions of medical practice should be similar throughout Australia rather than wholly at the mercy of the several States in some of which these are the subject of unfavourable action already It is moreover always wise in appearing before an arbitration court to cultivate a friendly rather than an unfriendly atmosphere

The Federal Council is of course already busy preparing the case for the profession It has engaged solicitor and counsel to appear before the Commission on its behalf It is organizing opinion in each of the States of the Commonwealth It is establishing an Emergency Fund to be collected by the Branch Councils with the suggestion " that an

amount of ten guineas be asked of members of the Association as a first contribution," and it has already been announced that the Council of the Association at home is making a grant from central funds of £1,000 towards the cost of preparing and presenting the profession's case in Australia More than one questionary has been issued to members throughout Australia, and the results of these will be very carefully considered and formulated If they elicit unimpeachable facts these will be of value for the information and use of counsel, but for the purpose of forming or ascertaining opinion the method is very unreliable It is to be hoped that experience in this country, both as to the working and effects of similar legislation here and as to the methods of approaching and influencing Government Departments and tribunals, will be fully availed of and accepted as useful The Act has now been passed, the Government's intentions and determinations are known They are based upon the popular endorsement of electoral promises This being accepted, the whole British Medical Association will desire to help the Federal Council in its present important task and will wish it every success

GREATER VISION

In his presidential address before the British Association for the Advancement of Science at Cambridge this week Lord Rayleigh dwelt for the most part on the subject of "Vision in Nature and Vision Aided by Science" The unassisted eye, he said, has a field of view extending nearly over a hemisphere, it gives an indication very quickly and allows comparatively rapid changes to be followed It responds best to the wavelengths actually most abundant in daylight or moonlight This combination of qualities is ideal for what we believe to be Nature's primary purpose—that is, for finding subsistence and for fighting the battle of life against natural enemies But by sacrificing some of these qualities we can enhance others for purposes of research The use of lenses is one of the greatest scientific discoveries we do not know who made it A glass bulb filled with water may have been the first lens, and the magnification was ascribed to the nature of the water rather than to its shape We may compare the picture on the retina to a design in woolwork the details must conform to the mesh of the canvas, so with the retina But if the object to be seen is distant we want a lens of longer focus than the eye lens, so we neutralize this with a concave glass or eyepiece, then use a long-focus lens called the telescopic objective to make a larger picture on the retina Given perfect construction there is no limit in theory to what a telescope can do in revealing distant worlds On the other hand, with the microscope there is a very definite limit details one-hundred-thousandth of an inch apart cannot be distinguished But something may be gained by the use of ultra violet light instead of visible light It then becomes necessary to work by photography This method offers some hope of progress in connexion with the fundamental problem of the nature of viruses Paradoxically, for certain radiations we can make optical converging lenses out of empty space, or, alternatively, we can make optical observations without any lenses at all Cathode rays can be bent by electric or magnetic forces, constituting what has been called an electrostatic or magnetic lens With this it is possible to form a magnified image of the source of electrons on a fluorescent screen or on a photographic plate Colour vision is one of Nature's most wonderful achievements Anatomy has told us little of how the marvel is achieved no anatomical peculiarity is known to distinguish the colour-blind Artificial resources can improve colour discrimination The spectroscope is such an instrument, and there are now a number of the spectroheliоscopes in different parts of the world making continuous observations

We cannot supplement the retina, but in certain cases we can do better—we can substitute an artificial sensitive surface The photographic plate is not the only useful substitute, we have another in the photo electric surface, and this can be used at the focus of an astronomical telescope Its great interest lies in the possibility of accurate measurement, and it has been developed further into the basis of television There is a photo electric mosaic, each element of the surface forms a separate tiny condenser, scanning is achieved by rapidly traversing a beam of electrons over the mosaic line by line The process is reversed as the beam of electrons falls on the luminous receiving screen and makes it light up more or less brightly according to the intensity of the electron beam It seems not unlikely that the electric eye or iconoscope may have other uses It might be used to make visible the image in the ultra violet microscope, which would be much too faint for direct projection on a screen or for photography Concluding this part of his subject, Lord Rayleigh said "Much of modern scientific doctrine appears at first sight to have an elusive and even metaphysical character, and this aspect of it seems to make the strongest appeal to many cultivated minds"

Dealing with "Science and Warfare," in the second part of his address, Lord Rayleigh said

that it had been urged that science was the source of all the present trouble and we might look to scientific men for some constructive contribution towards finding a remedy He then proceeded to show that all the modern terrors of war were either applications of old discoveries or of discoveries that had the most innocent of origins Shakespeare lamented the use of the high explosives of the time Poison gas killed Pliny at Vesuvius in A D 79 Thermite was developed for welding iron pipes Aircraft, apart from balloons began as a means of sport in gliding It is true that novelists have foretold the horrors that may come to pass but experienced organizers of military objectives poured scorn upon their suggestions Summing up what may be learned from the experience of the past Lord Rayleigh said "I think we may say that the application of fundamental discoveries in science to purposes of war is altogether too remote for it to be possible to control such discoveries at the source For good or ill, the urge to explore the unknown is deep in the nature of some of us and it will not be deterred by possible contingent results, which may not be and generally are not fully apparent till long after the death of the explorer Can we then, do nothing? We hope that our discussions on the social relations of science will bear useful if modest fruit in promoting international amity"

JAUNDICE AND ARTHRITIS

The effect of jaundice on rheumatoid (atrophic) arthritis and primary fibrositis has been the subject of intensive research by Dr Philip Hench[1 2] at the Mayo Clinic during the past five years and also by such workers as Thompson and Wyatt Sidel and Abrams And it is interesting to recall that so long ago as 1903 Dr John Wishart[3] in a short note to this *Journal* wrote "When jaundice of an obstructive type becomes fully established in the system of a patient suffering from chronic rheumatism rheumatoid arthritis or muscular rheumatism the pains characteristic of these diseases disappear entirely" Dr Hench whose paper read at the International Conference on Rheumatism at Bath this year appears elsewhere in this issue has observed forty five cases altogether these included twelve of primary fibrositis four with lumbago or sciatic pain and one of hypertrophic arthritis The relief was most pronounced in fibrositis and rheumatoid arthritis—a remission of symptoms lasting from three weeks to many months—but in no case was there a complete cure There was a general but not a specific relation between the time the remission lasted and the intensity and duration of the jaundice The type of jaundice did not appear to be of any importance A large proportion of patients had intrahepatic jaundice due to cinchophen but gouty arthritis was not relieved Margolis has recorded that in one instance gouty arthritis appeared during the course of the jaundice Thompson and Wyatt[4] studied the effect of the biliary constituents alone and in combination They found that neither bilirubin alone nor bile salt alone was of any use but that the two in combination gave definite relief On the other hand Hench observed that the analgesic effect continued in the presence of severe hepatitis when presumably there was a reduction in the amount of circulating bile salts Injection of bilirubin alone in substantial amount was of no avail and no improvement in the articular symptoms followed the oral administration of bile In some instances analgesia was experienced before the jaundice became obvious but in most the zone of therapeutic effectiveness seemed to begin at a level of 8 to 10 mg of bilirubin The relief was generally prompt speedy and complete with a remarkable retrogression of the general arthritic symptoms but this proved to be only temporary although it occasionally lasted for some time after the jaundice had disappeared Hench considers that the relief of arthritis often observed during pregnancy is most probably due to some similar agency and points out that a close chemical relation exists between such substances as cholesterol ergosterol bile acids cortin and some of the sex normones Najib-Farah[5 6] studying the effect of bile upon pneumococci found that bilirubin in concentration of 4 to 5 mg per litre caused disintegration to begin while complete lysis occurred at 8 mg He noted that the solubility varied directly with the virulence of the strain employed and that avirulent strains were unaffected even at 10 mg per litre virulent streptococci were equally unaffected He also observed cases of pneumococcal infection in which the symptoms of acute rheumatism appeared with a bilirubinaemia of 1 5 to 2 units (van den Bergh) He concludes from this and other observations that bilirubin is mobilized in the blood as a defence against pneumococcal infection and that the toxic substances liberated from disintegration of the organisms may give rise to an allergic reaction expressed as acute rheumatism Najib Farah advances the view that bilirubin is a factor in the processes of defence and immunity Race[7] has observed that in arthritis the icteric index and the concentration of serum bilirubin are lower than normal and that the bilirubin deficiency was not the chief cause of the low icteric index The common factors in these various observations would seem to indicate the need for an investigation of the part played by bilirubin in acute chronic infections

SILICOSIS AND PULMONARY CARCINOMA

One of the most striking instances of carcinoma induced by extrinsic factors is the carcinoma of the lung which occurs in a very high proportion of workers in the Schneeberg and Joachimstal mines The miners in these areas are also liable to pneumonoconiosis and although the carcinogenic agent has not been identified most

observers suspect arsenical derivatives or radio active substances rather than silica Bronchial carcinoma has, however, occasionally been described in cases of silicosis, and three cases of this sort observed by Dible[1] suggested to Anderson and himself that a determination of the silica content in a series of cases of bronchial carcinoma might be instructive, their results have now been published[2] The series consists of forty eight controls and seventy consecutive cases of primary carcinoma of the lung both series being drawn from the same hospitals The cases in the control series were not "especially selected except that cases of malignant disease were excluded, as were also examples of gross pathological abnormality" In these the total silica content of the two lungs averaged 0 26 gramme and the range of variability was small In the carcinoma series 83 per cent (58) had the same mean silica content as the controls, but in 17 per cent (12) there was a very high silica content (mean 2 29 grammes) Of these twelve cases there was gross histological evidence of silicosis in ten and in the other two there was such fibrosis as "would only arouse a suggestion of silicosis" Further, in five of the cases the patients had followed occupations in which silicosis is a known risk, and four others were liable to be exposed to siliceous dust These observations are of considerable interest, but the authors' conclusion that "the role of silicosis is aetiological in a group of cases of pulmonary carcinoma" is not justified from their findings even though it be true The primary fallacy is one of sampling No mention is made of the post-mortem incidence of primary carcinoma of the lung or of silicosis, taking 2 5 per cent as the average [illegible] incidence of carcinoma of the lung would have been in the likelihood of 3,000 rather than fifty if the relation between silicosis and bronchial carcinoma were to be compared Further, in the control series cases with gross pathological abnormality—and so, presumably, pulmonary fibrosis—were excluded Anderson and Dible's assumption is unjustified from another aspect Although silicosis and pulmonary carcinoma were associated in ten cases yet these patients were all from different occupations in which silica was only one of the risks to which they were exposed This is emphasized in the careful study of the incidence of pulmonary cancer carried out by N J and E L Kennaway[3] In examining the death certificates of all the pulmonary cancers (8,808) recorded between 1921 and 1932 they gave special attention to the possible relation between exposure to siliceous dust and cancer of the lung They found that although a raised incidence occurred in metal grinders, pavers, sand-blasters, stonemasons, and pottery-ware makers, yet there were normal or low figures in stone miners, quarriers, pottery kiln workers and coal-miners, and concluded that the "factors which lead to silicosis are not very active in producing cancer of the lung" Apart from its intrinsic merit Anderson and Dible's work is of value in that it calls attention to the need for publishing the post-mortem changes in a large series of cases of silicosis Vorwald and Kerr,[4] working at the Saranac laboratories, have collected all the published accounts of cases of silicosis together with a smaller series of their own According to the radiological evidence of 57,000 persons exposed to dusts there were signs of silicosis in 12,000, and of a pulmonary tumour in only three (0 005 per cent) At the Saranac laboratories 15,000 dust exposed persons were examined, of these, 1,357 were diagnosed as cases of silicosis, and in one there was a tumour (0 074 per cent), in the remaining group showing no radiographical evidence of fibrosis there were two cases of tumour (0 014 per cent) With reference to post mortem evidence the authors state that of the 444 published cases, a neoplastic condition was found in ten, of which four were pulmonary (1 3 per cent) The figures of the South African Miners' Phthisis Bureau show that of 3,000 necropsies on European miners there was evidence of silicosis in 47 per cent, and that pulmonary carcinoma occurred in twenty two cases, the incidence being the same in the silicotic and the non-silicotic groups—0 7 per cent At the Saranac laboratories a series of 178 necropsies revealed silicosis in 76 per cent and six neoplasms, of which two (1 1 per cent) were pulmonary This mass of evidence is strongly against Anderson and Dible's hypothesis, but it is interesting to note, in view of Turner and Grace's[5] observations at Sheffield, that of the four pulmonary tumours (one case appears in both series) observed in dust-exposed persons at Saranac, three were in men who had worked in iron mines A recent review by Nordmann[6] suggests the possibility of asbestosis being predisposing to pulmonary carcinoma, but the recorded instances are as yet too few to be significant There is still need for a critical pathological study of a large series of dust-exposed persons, but it is imperative that they should be considered in relation to their various occupations as well as to their "silicosity"

THE ROLE OF ADRENALINE IN ANGINA PECTORIS

When it was found that after total thyroidectomy for angina pectoris the improvement observed could not be correlated with the fall in the basal metabolism, several workers claimed that a diminished production of, or a diminished sensitivity to, adrenaline was responsible[7 8] It is now suggested by Raab, however, that adrenaline plays a chief part in all cases of angina of effort[9] So important does he think adrenaline to be that he recommends vigorous treatment directed towards a reduction of suprarenal activity He adduces many arguments in favour of his view, pointing particularly to those cases of paroxysmal hypertension (both with and without suprarenal tumour) and paroxysmal tachycardia which are accompanied by anginal pain, he quotes a case of a doctor in whom a subcutaneous injection of 1 3 mg of adrenaline led to precordial pain and a rise in systolic pressure from

[8] *Presse med* 1936, 44 1307
[9] *Arch Kreislaufforsch* 1937, 1 255

120 to 220 mm Hg Later there was collapse with a great fall in blood pressure when the pain disappeared An attack of auricular flutter supervened but this was cured with quinidine Raab believes that adrenaline is responsible in those cases of angina decubitus in which there is a definite increase in the blood pressure and pulse rate and it is stated that during these attacks the iodine content of the blood rises a finding also reported during effort and on exposure to cold the change in iodine content is held to be secondary to increased output of adrenaline The angina which may happen in association with insulin hypoglycaemia and also as a result of smoking is likewise thought to involve an adrenaline effect The author admits that in many cases of hypertension with tachycardia angina is absent but without any evidence suggests that increased production of adrenaline does not occur in such cases In brief the thesis presented is that every factor which leads to angina is an 'adrenalina gogue The author has sufficient faith in his hypothesis to use deep x ray therapy for reducing suprarenal activity in the treatment of angina He suggests that it is practically harmless but admits that Addison's disease has resulted and has been fatal details of twenty cases are given and good results are claimed In so far as adrenaline is involved in the physiological reactions of the cardiovascular system to effort and emotion so far it may be conceded is it concerned in effort angina But Raab attributes to it a more direct role than this believing that it interferes with the utilization of oxygen by the myocardium The evidence brought forward is unconvincing the arguments appear illogical and treatment designed to inhibit the suprarenals cannot yet be regarded as a rational procedure in angina

DEMONSTRATION OF TUBERCLE BACILLI IN THE SPUTUM

In a report[1] on this subject published by the Joint Tuberculosis Council and compiled by Professor W H Tytler Dr Peter W Edwards and Dr H G Trayer the methods of demonstrating the bacilli by the microscope by culture and by animal inoculation are all reviewed and discussed in detail Comparing the efficiency of the three methods the authors note that apart from sensitivity each has advantages and disadvantages related to convenience and possibility of error Hence two sections are devoted to the application of the methods in clinical routine and to sources of error The authors hold that the concentration culture and inoculation methods are far better than direct film examination Since for the all important end of early diagnosis the most delicate methods are needed when clinical suspicion rests on indefinite evidence these should logically be applied whenever there is any suspicion These methods are technically less complicated than many in constant use in the more advanced general hospitals The authors believe that it is for financial reasons alone that medical officers treating tuberculosis are denied laboratory aid of the quality available to those treating other diseases Another reason may be that the knowledge of the superiority and clinical value of these methods is by no means recognized by all the authorities responsible for treatment of tuberculosis The report should do something towards remedying this The authors conclude that the specimens to be examined are so numerous that the public health and other laboratories serving most of the tuberculosis organizations of this country cannot undertake as a general routine any but the simplest tests without important increases in their staffs and accommodation "In general the greater the need the more inadequate are the attempts to meet it If the laboratory facilities available to the tuberculosis services of Great Britain are to be brought up to the levels already reached in smaller and much less affluent countries an important increase in the expenditure on this object is essential They conclude with little more than a mention of the examination of gastric contents for tubercle bacilli but point out that though this method has not so far found great favour in this country it is of special value in infants and in adults who swallow their sputum

THE TEACHING OF MEDICINE

An interesting and useful footnote to the discussion on the medical curriculum is to be found in the report of a subcommittee of the Association of Scientific Workers appointed to examine the clinical period of instruction Like the recent conference of the National Union of Students on 'The Training of the Doctor [1] the report presents in the main the observations of the learner and not of the teacher and is therefore admittedly incomplete but this point of view is if considered and deliberate of paramount importance The report is contained in the current number of *The Scientific Worker*[2] and has been reprinted as a pamphlet entitled "The Teaching of Medicine It is so succinctly drawn up as to preclude further summarizing but in its main observations and criticisms it is in general agreement with the reports of the British Medical Association and of the universities and examining bodies which now constitute the basis of discussion of this subject in this country Beyond these points of agreement not all of which have yet been incorporated in the Rules and Recommendations of the General Medical Council some findings have a distinct significance It is pointed out that the University Grants Committee report (1935) suggests a lack of individual teaching in medical subjects which is so important In certain teaching hospitals there is only just over one teaching bed per student there are clinical 'teaching rounds consisting of thirty or more students classes of fewer than ten students do not occur and there is no attempt at tutorial teaching properly so called Moreover it is notorious that even the minimum requirements of the General Medical Council are not complied with in every instance especially with reference to obstetrical cases and anaesthetics (*though it must be noted that in regard to this* last these requirements have now been differently phrased) Thus the relation of available teaching facilities to the number of students though varying

British Legion Press Preston Hall Industries Incorporated Kent

[1] See *British Medical Journal* July 23 1938 p 192
[2] Volume X No 3 July–September 1938

widely in different schools, is, speaking generally, sadly deficient Further, it is alleged that the methods of teaching, as well as the facilities have noteworthy shortcomings more especially perhaps in pathology, bacteriology, and forensic medicine , and it is stated that lectures on occupational diseases and child guidance seem conspicuous by their absence and that the psychoneuroses are " sometimes introduced into lectures on neurology " or may be represented by " six lectures on insanity " An interesting statistical observation is that the percentage of those qualifying who subsequently held house appointments in their own hospitals varied from twenty to ninety, though no doubt others held internships elsewhere The practical suggestions of the report under the heading of " the medical curriculum as it might be " will perhaps not command very wide assent at present The relationship of the ordinary medical curriculum and research is possibly misconceived , but though the scheme of the report for the three-year clinical period is not universally practicable or desirable, it would be interesting and valuable to have it tried out as an experiment

LIMITATION OF OPIUM PRODUCTION

The Advisory Committee of the League of Nations on the Traffic in Opium and Dangerous Drugs has recently been in session in Geneva preparing for a conference to be convened with a view to the limitation and control of the cultivation of the opium poppy and the production of raw opium The objective is a necessary and indeed a prerequisite step to the effective restriction of narcotic drugs to legitimate and scientific purposes While the existing Conventions of 1912, 1925, and 1931 appear to have largely secured the limitation of licit traffic, there can be no doubt that superabundant supplies of raw opium in certain countries have led to an increase in the clandestine manufacture and distribution in large quantities of morphine and heroin The suppression of illicit factories and traffickers in the Near East has transferred such commerce to the Far East Excessive production of raw opium there and clandestine manufacture of dangerous narcotics therefrom have proved to be perilous to other countries, to which they find their way by underground channels The due carrying out of international obligations by contracting countries is thus disturbed and the progressive abolition of opium smoking hindered or postponed The Committee realizes that opium is being produced in quantities in excess of recognized world requirements, even including those of Government monopolies in countries where opium smoking continues It is estimated that the world's annual need of raw opium is about 1 100 tons 300 tons for the manufacture of preparations for legitimate medical purposes 300 tons for the smoking monopolies, and some 500 tons for " other non-medical legitimate consumption " On the other hand, statistics show that, even excluding unrecorded production in Afghanistan and in the Far East the world production in the year 1936 amounted to 2,300 tons Moreover, there were in addition in that year estimated stocks in the producing countries of the alarming total of 3,500 tons Accurate information as to the actual production in China, Manchuria, and Jehol is not available, but it is estimated to exceed by far the production of the whole of the rest of the world The magnitude and difficulties of the problem before the Committee are obvious, and the principles to be applied by the promised Convention in fixing world production, in allocating to each producing country its quota, in regulating imports, exports, and stocks, and in controlling the whole system, will be submitted to the Governments for their observations, and they will be considered at the next meeting of the Advisory Committee

MEDICAL POSTGRADUATE STUDY

In 1909 an International Committee on Postgraduate Medical Study was formed in Budapest, and two international congresses were held before the war, there and in London For twenty-four years the movement was at a standstill The original general secretary, Professor Adam of Berlin, with an *ad hoc* preparatory committee, restarted it in 1937 and gathered delegates from forty-four countries to the third conference in Berlin The full report of that congress, in the form of the speeches and lectures, with translations into English, is now published in a volume of 410 pages[1] At the further International Congress held this year in Budapest, a permanent office was formed in Berlin to arrange congresses, organize interchange of teachers, students, and literature, and so on, under the title of the " International Academy of Postgraduate Medical Education " The report of the 1937 Congress gives the origin and history of this proceeding, and is therefore of considerable interest It also gives details of postgraduate work in many countries, and a series of lectures on the problems of postgraduate study in obstetrics, surgery, radiology, psychiatry, and other special subjects, and of sessions devoted to postgraduate study in relation to cancer research and industrial medicine Of particular interest are the speeches of the German delegates and of Dr Wagner, the Reichsarztefuhrer, on the place of the doctor in the New Germany and what National Socialism expects of him, on the " refresher course " system for German doctors, and on the new attitude to homoeopathy and " natural medicine " To most people what is here written, and still more what can very easily be read between the lines, will give rise not only to surprise but to very grave misgivings concerning the future of medicine under National Socialism A pleasant feature of the speeches is the stress laid by delegates of all countries on the friendly atmosphere of the conference and on the value of international relations between doctors as a means of furthering mutual understanding between nations, and on the essential wish of all doctors for peace

[1] *Bericht uber den III Internationalen Kongress fur arztliche Fortbildungswesen* Berlin, August 21–25 1937 Edited by Dr Blome and Professor Adam (RM 18 , bound, RM 20) Jena Gustav Fischer 1938

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

TREATMENT OF TENOSYNOVITIS AND GANGLION *

BY

E PEARCE GOULD, F R C S

Simple Tenosynovitis

This is a frequent affection and involves most commonly the sheath of the extensor tendons on the back of the wrist It is also met with in the foot and may here involve either the sheaths of the dorsiflexors beneath the two portions of the anterior annular ligament or those of the peroneal tendons behind and below the external malleolus In any of these situations the diagnosis depends upon the recognition of the exact extent of the local swelling which is soft in consistence and yields a characteristic soft tremitus to the examining hand when the appropriate tendons are actively moved In some cases there is a history suggesting overuse of these tendons either at work as for instance in typewriting or at play as after vigorous lawn tennis or squash rackets

In all cases treatment should take the form of the application of elastic strapping to the swollen area for ten days and the avoidance for double this period of that use of the limb which appears to have been the cause of the condition When a toxic element in its aetiology is discoverable—for example gout or fibrositis—appropriate medical treatment in the form of colchicum or a mixture of sodium salicylate and iodide of postassium is worth a trial in addition to the local treatment Should the condition persist after the above mentioned period a plaster of Paris case similar to that used in the treatment of a fractured scaphoid bone is applied to the wrist hand and forearm and left in position for two weeks On its removal elastic strapping is reapplied for a further week whilst full use of the hand is regained

Stenosing Tendovaginitis

This condition occurs in two forms (1) as a chronic thickening of the sheaths of the extensor pollicis brevis and abductor pollicis longus and (2) as a strictly localized thickening of the tendon sheath of a finger flexor opposite the metacarpo phalangeal joint causing the clinical condition of snap-finger In the first case there is found an elongated swelling situated over the radial styloid process Palliative treatment is disappointing Operative treatment is simple and satisfactory After infiltrating the skin over the swelling with 1 per cent novocain an incision one and a half inches long is made in the line of the swelling and the dissection carried down to and through the superficial layer of the tendon sheath The thickened layer encountered is dissected away until the tendons are found to move freely The skin is then carefully resutured The operation is preceded by a cleansing of the skin with soap and water ether and spirit Its swift and accurate performance is facilitated by operating in a bloodless field This is obtained satisfactorily and simply by elevating the arm for two minutes with a sphygmomanometer cuff applied above the elbow With the arm still elevated the cuff is quickly pumped up to a pressure of 130 to 140 mm Hg and the operation then begun Under no circumstances must this pressure be maintained for more than twenty minutes lest serious and possibly permanent nerve paralysis result The pressure should be relaxed before closing the wound so that accurate haemostasis with 00 catgut ligatures is secured A firm dressing is maintained until the skin sutures—of medium silkworm gut—are removed on the seventh day after which full use of the hand is allowed

The cure of snap finger requires the operative exposure and removal of the offending local fibrosis This operation involves a careful dissection in the palm of the hand and is best regarded as a major surgical procedure

Gonorrhoeal Tenosynovitis

This condition is often associated with gonorrhoeal arthritis and may complicate but rarely gonorrhoeal ophthalmia and the vulvovaginitis of young girls Either of these conditions or the more usual urethritis in the male or cervicitis in the female will continue to receive appropriate treatment The treatment of the local condition is governed by regard for the possible development of an abscess within the affected sheath and the extreme probability of the late formation of troublesome adhesions The tendon sheaths most often involved are those of the extensor tendons of the hand or foot The acute phase of onset calls for the local application of 10 per cent ichthyol in glycerin painted on twice daily and covered by white lint and a bandage and rest to the part As the redness of the skin subsides and the pain lessens this treatment is replaced by firm elastic pressure maintained until all pain has gone Active movement with use of the part is now encouraged Return of pain without redness of the skin demands a further period of rest and pressure

Return of pain with localized redness indicates local suppuration As soon as fluctuation is evident after cleansing of the skin an incision should be made the pus evacuated and zinc and castor oil ointment and sterile gauze applied This is changed daily until healing is complete When return of function is delayed owing to adhesions inductotherm is extremely useful followed by passive movements

In obstinate cases in which an interval of three months has elapsed since the last sign of activity manipulation under gas and oxygen anaesthesia should be employed

Tuberculous Tenosynovitis

This disease is most commonly met with as an affection of the radial and ulnar bursae still commonly called in this country compound palmar ganglion a chronic elastic or fluctuating bilobed swelling is found on the front of the wrist and palm the two prominent parts of the swelling communicating beneath the tense anterior annular (anterior carpal) ligament Involvement of the whole of the flexor sheath of the thumb or little finger may produce a prolongation of the palmar prominence along one or both of these digits Rarely, the disease is

* The treatment of acute infections of the tendon sheaths of the hand is omitted from this article This condition will be dealt with later

confined to the flexor sheath of the index, middle, or ring finger, and still more rarely to the common extensor sheath on the back of the hand

Treatment varies with the stage reached by the disease when first seen, and also by the pathological variety encountered If the case be an early one in which the history of swelling is recent and in which no fluctuation or melon seed-body fremitus is detected, complete immobilization of the wrist and hand by a plaster-of-Paris case should be tried This splint is left undisturbed for three weeks If at the end of that time there is obvious improvement a further splint is applied In a favourable case, at each successive inspection the swelling is found to be lessening, and when this is reduced to little more than a localized induration splintage is omitted, and cautious use of the hand supplemented by inductothermy or other form of heat application gradually overcomes the resultant stiffness

If, however, the disease is more advanced when first seen, and fluctuation is easily obtainable throughout the swelling, plaster-of-Paris fixation should be preceded by an incision into the affected sheath to allow of evacuation of all the fluid or semi-fluid contents, including melon-seed bodies if present In the common type, the compound ganglion, the incision should be above the wrist into the upper compartment, and must avoid the line of the median nerve It will be remembered that the nerve lies to the ulnar side of the tendon of the flexor carpi radialis, between it and the palmaris longus tendon if present The ulnar border of the former tendon can always be felt in the forearm above the upper limit of the distended flexor sheath, and gives the necessary guide to the course of the nerve Secondary infection of the sheath is to be avoided at all costs, and careful cleansing of the skin must therefore precede the incision For the same reason accurate suture of the incision must follow emptying of the sheath contents, and the wound should be sealed with a mastisol, collodion, or Whitehead's varnish dressing before the plaster case is applied A similar procedure should be adopted if, when the plaster applied as initial treatment is removed, it is clear that fluid has accumulated Here again a bloodless field is of great assistance, but the warning given above as to its danger if used carelessly must be repeated

Some cases come for treatment late, or, in spite of early treatment, the pathological changes progress A doughy swelling with loss of clear definition of its edges and perhaps adhesion of the skin over it indicates a progressive fibro-caseous degeneration Confirmation of this more serious condition may be found in loss of function of one or other tendon, due to its necrosis within the sheath or loss of sensation in part of the skin area supplied by the median nerve, caused by involvement of the nerve, which readily becomes adherent to the diseased sheath In cases of this kind a wide opening-up of the sheath with free excision of the diseased and destroyed tissues alone offers any hope of cure Such operations, together with subsequent attempts to replace lost tendons, come under the heading of major surgical procedures

Simple Ganglion

In the great majority of cases the swelling to which this diagnostic label is attached is the result of the mucinous degeneration of a fibrotic change in a limited area of the wall of a tendon sheath In a few cases a distended protrusion of the synovial membrane of a carpal joint produces a local swelling with much the same clinical features In either case the actual disability caused by a simple ganglion is as a rule less than the annoyance occasioned by the conspicuous lump on hand or foot These considerations have a bearing upon treatment, the latter by emphasizing the unwisdom of embarking hastily upon operative measures difficult of performance and not entirely free from complications, and the former as suggesting in advance that attempts to aspirate a substance of the consistence of glycerin jelly through a small hollow needle are bound to fail

If the time-honoured method of "dispersing" the swelling by a smart blow with the broad end of the family Bible savours of lay rather than medical practice, there is much to be said in favour of its surgical equivalent —namely, the disruption of the gelatinous material into the surrounding tissues by the pressure of the surgeon's superimposed thumbs If this manœuvre is adopted at a time when the local proliferation has undergone complete degeneration into the mucinoid material, and is followed by a firm pad of elastoplast worn for a day or two, a lasting cure is effected Sometimes the swelling will not yield to such pressure as the patient is willing to stand, in such a case a further attempt after a few weeks' interval will probably succeed Apparent re collection of the contents some weeks later is due either to degeneration in a part of the lesion which was still fibrous at the time of the treatment, or to the original swelling having been in fact an instance of the true joint synovial pouch In this latter case fixity of the swelling on its deep surface and its exact anatomical site will confirm the diagnosis In this variety operation is the proper course

After due preparation of the skin the sac should be exposed in a bloodless field (see above) and dissected carefully to the joint margin At this level it should be cut away and no attempt made to close the small aperture in the capsule The skin should be carefully sutured and local pressure applied until the wound is healed But in the common variety of simple ganglion open operation is to be avoided for the following reasons (1) In the course of the operation the thin fibrous membrane which contains the mucoid material is almost certain to give way it then becomes difficult to define (2) An attempt to make sure of a complete cure by removing all this membrane leads to a wider dissection than at first envisaged, with possibly considerable exposure of tendons (3) Especially in the front of the wrist, important structures lie in close proximity to the swelling the files of medical defence societies contain more than one instance of threatened action by the patient against his doctor for such complications of an operation for ganglion as injury to the median nerve

If treatment by compression is unacceptable or fails, a prudent and satisfactory alternative is as follows After cleansing the skin and raising a wheal at one edge of the swelling with 1 per cent novocain insert a narrow scalpel of adequate length, or, better, a pointed tenotome, through the skin at this point across the swelling and just through its opposite edge A slight rocking movement of the knife will then tear the limiting membrane without penetrating the skin on the distal side When the knife is withdrawn the minimum of pressure with the fingers will now disperse the swelling, a little of the characteristic jelly-like contents perhaps escaping from the puncture wound A drop of collodion on a wisp of wool seals this puncture, and a patch of elastoplast left on for a day or two completes the treatment

A STRICT VEGETARIAN DIET

BY

Sir LEONARD HILL, LL.D., M.B., F.R.S.

It may be that the fuel value of the man's diet is put as high as 3,400 calories because a diet largely consisting of meat white bread cheap margarine and sugar is badly selected and therefore eaten in large amounts not only to satisfy appetite excited by cooking and flavours but also to secure more of the vitamins and minerals which are inadequate in these foods.

The calorie and protein values can in this case be lessened when the diet is largely one of fresh fruit and vegetables. It must be kept in mind that protein in particular stimulates heat production. Hindhede at the age of 80 claims that he bicycles all over Denmark with ease on a diet of skimmed milk and potatoes. The Japanese rickshaw runners can pull a passenger even sixty miles in a day on a diet of rice salad and a little fish. On the other hand the Eskimos are healthy and free from rheumatism on a diet of raw meat liver, blood, etc. with some fish duck and a little sorrel and moss.

The Boy and his Dietary

In the above respects the following is of interest in regard to the diet of a boy whose parents people of culture are strict and ardent vegetarians. His home is in a wood isolated from other houses and two miles from any shop. He is aged 9, weighs 59 lb. and is 52 inches high; he is bright and intelligent with clear skin and eyes, walks ten miles a day with ease, takes a cold bath every morning and an air bath out of doors. He has a remarkable power of chest expansion and abdominal retraction due to breathing exercises. He does well at school and holds his own with other boys. He eats no meat, fish, eggs or bread at home and scarcely any milk or cheese but is allowed to eat bread and butter and cake when he goes out to tea about once a week.

He goes to a day school two and a half miles away and there has vegetables for dinner with some fruit. He may of course get a few sweets from other boys but boys are not ready to give away much.

The following is typical of a day's diet which his parents guarantee to be given to me correctly. By personal inspection and inquiry I have not been able to find any source of error.

Breakfast.—After walking five miles to church and back. One fairly thick slice of pineapple weighing about 6 oz.

Lunch.—Baked spinach and onion pie with a very thin crust made of wholemeal flour cheese and milk about 10 oz. in all.

Tea.—Two apples, one orange, two small tomatoes in all about 12 oz. including the skin of the orange. One small ice.

As variants for any one of these meals he may have salad and 2 oz. of raisins or eight dates, two apples and 1 oz. of sour milk, or a vegetable pie and 1 oz. of honey.

Grapes, pears, bananas, water-cress, cauliflower eaten raw with a little salad oil may substitute any of the above.

His father writes:

> He is in fine form, full of life and energy and getting stronger and tougher rapidly. Anybody who likes could come and observe; there is no deception, only the workings of God's laws of nature in a clean young organism. It is only due to too many tea parties and consequent starch and sugar consumption that he ever gets mildly out of sorts and is not at his best until the poisons have been eliminated sometimes by a short fast. But his vitality is so strong that he can clean his small body internally—*i.e.* blood and tissues—with extraordinary speed. I am quite satisfied that it is not possible for him to develop any serious symptoms due to infection—from which he has so far remained free.

Confirmatory of his father's claim that the boy lives on a diet much like that given by his parents is the fact that the total nitrogen determination was 4·43 grammes in the twenty-four hours' urine, equivalent to a consumption of 28 grammes of protein. The urea came out as 2·05 per cent. and a total of 9·65 grammes in twenty-four hours. A second sample of twenty-four hours' urine taken some weeks later gave figures in good agreement. Dr. H. E. Archer, who made the determinations for me, said he had not come across so low a value for protein metabolism before. Dr. W. A. R. Thomson examined the boy and determined his basal metabolism for me at St. Thomas's Hospital. The boy was brought there in a car at 9 a.m. having had no breakfast and then rested on a bed for an hour. The result was slightly above normal. The excitement would naturally put his oxygen use up. The figure was 215 c.cm. per minute. Dr. H. J. Taylor found his excretion of vitamin C in the urine was six times as great as is normal for people on an ordinary diet.

Comparison with Apes' Dietary

In striking contrast to this boy's diet which from the data given for one week scarcely came to 800 calories a day is that of the chimpanzees and gorillas at the Zoo, particulars of which were kindly given me by Dr. G. M. Vevers.

The diet of the Zoo chimpanzees weighing male about 175 lb. and female 120–130 lb. gives approximate values for protein 145 grammes, carbohydrate 850, fat 220, calories 6,000. The animals probably get about four-fifths of this or 4,800 calories. The diet of the gorillas was even more ample. The post-mortem examination of Mok, the gorilla which died, showed besides a subacute pneumococcal septicaemia evidence of over-feeding but the chimpanzees keep slim and in good condition.

Mona, the female gorilla, diet has now been reduced by one-third while the same wide selection of foods is maintained.

Average Daily Amount of Food for Adult Chimpanzee.

Food	Weight in grams	Extra Winter Food Weight
Bananas	1,320	Grams
Apples	450	
Oranges	315	
Grapes	450	
Lettuce	250	
Bread*	300	300
Eggs	55	
Milk	1,747	
Carrots	450	
Potatoes	450	
Nuts	225	112
Biscuits	225	112
Margarine	30	30
Jam	25	25

* Each 2 lb. loaf contains 2 oz. soya flour and 4 oz. bone flour.

R. J. Boursais (*These Paris* 1938, No. 166) who records fourteen cases in women aged from 20 to 43 states that chancre of the vaginal walls is much less frequent than chancre of the cervix. It appears to be commoner in prostitutes than in other women in whom it is probably often overlooked. Failure to recognize vaginal chancre explains the discovery of syphilis only in the secondary stage—the so-called syphilis without chancre which is more frequent in women. Vaginal chancre offers a great risk of infection. On the other hand if it is detected early a source of contagion may be removed which is all the more dangerous as it may remain unrecognized for weeks until the secondary symptoms appear.

INTERNATIONAL HEALTH MEASURES

THE PERMANENT COMMITTEE'S SURVEY

The report of the Medical Director of the International Health Office on the proceedings at the session of the Permanent Committee held in Paris last May has now been published[1] Dr M T Morgan of the Ministry of Health was again the delegate of the United Kingdom The detailed rulings and opinions of the Permanent Committee on the interpretation and application of the various international sanitary conventions have been transmitted for the information of Governments in the reports of the special Commissions

Defence against Cholera

The extension of cholera in the Far East during 1937 has led certain countries to increase their defence measures, and an exchange of views became necessary between the delegates of the countries concerned, particularly as regards the conditions under which anti cholera vaccination should be imposed Also in connexion with cholera—and particularly arising from an epidemic in the Celebes Islands, in which a vibrio exactly corresponding to the El Tor type had been isolated—the committee expressed the view that at the present time cases in which the clinical symptoms and signs lead to a diagnosis of cholera should be, from the administrative and preventive point of view, treated as cases of true cholera

The value of "O' antigen for the diagnosis of *V cholerae* was the subject of interesting reports from the Research Institute, Kasauli, and elsewhere Studies on the specificity of agglutinating sera carried out at the Institute of Public Health, Rome, seem to show that the Inaba 'O" antiserum contains active agglutinins which are specific for all proved strains of cholera vibrio and gives better results than the Ogawa and Napoli 'O' antiserum The American authorities, in accordance with the U S Quarantine Regulations, have required since August, 1937, compulsory bacteriological examination of the stools of passengers coming by sea into the Philippines from places where cholera is present In practice it was possible to exempt about 50 per cent of the passengers from this examination but nevertheless 10,407 passengers were thus examined of whom 296 were found to have the cholera vibrio in their intestines

Destruction of Rats in Ships

On the application of Article 28 of the Convention (periodic "deratization of ships) the committee recalled that deratization or exemption certificates should always be drawn up in such a way as to give the port sanitary authorities of subsequent ports of call all the necessary information, that operations for destruction of rats should be carried out with the maximum efficiency including if necessary, an increase in the concentration of gas and the time of exposure if the circumstances are such that uncertain results might be expected, and that inspection or deratization of a loaded ship is relatively ineffectual

An inquiry carried out in British ports showed that the proportion of rat-infested vessels is not, on the average, higher than 10 per cent, the proportion of seriously and repeatedly infested vessels is about 1 per cent These results are in general agreement with those obtained by a similar inquiry in Atlantic ports of the United States The committee reiterated its opinion, already expressed several times, that deratization within the period laid down under the Convention could only be justified by exceptional circumstances

Yellow Fever and Air Traffic

As regards the International Sanitary Convention for Air Navigation special attention as usual was given to the danger from yellow fever A precaution recently adopted in America requires from passengers coming from a zone which might be considered infected or suspected a declaration of origin in a form drawn up by the Pan-American Sanitary Bureau after consultation with the Governments concerned and the air transport companies The committee examined this form which seemed to have a practical value and, without wishing to suggest the general compulsory adoption of such a document, it considered that the air transport companies might usefully provide passengers with similar forms at their embarkation The forms are, in fact, designed to facilitate the inquiries which passengers may have to undergo under the terms of the Convention at subsequent air ports of call

Further study was made of the disinsectization ' of aircraft The committee took note of the researches in progress in British India and in the Union of South Africa The number of notifications concerning the creation of sanitary and anti amaril aerodromes received by the International Health Office bears witness to the development of the organization laid down by the Convention There appears to be steady progress in the destruction of mosquitos, especially in the neighbourhood of aerodromes, and information on the Stegomyia index in various African countries was laid before the committee

Experiments in the destruction of insects with an automatic apparatus were carried out on an Imperial Airways flying boat at Durban The substances used were pyrethrum extracts diluted with either five parts of carbon tetrachloride or ten parts of water Mosquitos placed in cages in various parts of the aircraft were killed in less than ten minutes In the United States a survey of five types of plane used by Pan American Airways showed that both on the external surface and in the interior of these aircraft there were a large number of places in which mosquitos might take refuge and to which "disinsectants" could not penetrate, except by direct spraying More complete streamlining, the use of appropriate screens, and the suppression of most of the hollow spaces are the means suggested to eliminate most of these harbourages

Immunization against yellow fever of the flying and ground staffs of Pan-American Airways, as well as of members of the United States Public Health Service, was begun in the Panama Canal Zone in August, 1937 By April 1, 1938 983 vaccinations had been carried out, and in the near future vaccination will be extended throughout Central and South America as far as latitude 30° S The strain used is 17 D The problem of the prevention of the carriage of mosquitos in aircraft flying in yellow fever areas without imposing undue restrictions on air traffic, continues to occupy the attention of the sanitary authorities of various countries Of these measures some concern the destruction of mosquitos during flight, others are concerned with the details of construction of aircraft so as to eliminate as much as possible the opportunities for carriage of these insects, while others are related to yellow fever vaccination of the personnel

Yellow Fever in Brazil

In Brazil jungle fever presents a problem with which the authorities are seriously concerned A vast region covering parts of the States of Minas Geraes, Rio de Janiero, and Sao Paulo is infected and a high death rate has been observed among howler monkeys, many thousands of protection tests carried out with the serum of different wild animals appear to confirm the opinion that several species of monkeys play an important part in the spread of the jungle virus No explanation is, however, as yet forthcoming of the method of preservation of the virus from one season to another in the south of Brazil, where several months go by each year without any human cases of yellow fever coming to light In Brazil use is made for mass vaccinations, of a pantropic virus known as Virus 17 D, obtained by culture on chick embryo from which the central nervous system has been removed This vaccine, which has in this way lost the greater part of its neurotropic virulence, confers a definite immunity which begins three weeks after inoculation, in 90 per cent of the cases no reaction occurs and it is slight in the remaining 10 per cent Considerably more than 200 000 persons have been inoculated up to the present in Brazil by this method

[1] Paris Office International d Hygiene Publique 195, Boulevard Saint Germain

Small pox

Morbidity and mortality statistics of small pox in Poland show that during the last twenty years the disease has decreased progressively since the introduction of compulsory vaccination in July 1919 This is illustrated by the fact that whereas in 1921 there were over 5 078 cases and 823 deaths in 1937 there was only one non fatal case Small pox in Poland may thus be regarded as extinct. The annual figure for vaccinations and revaccinations is round about 2 000 000 and up to the present no case of post vaccinal encephalitis has come to notice A severe epidemic of small pox occurred in the Gezira area of the Anglo Egyptian Sudan during the first months of 1938 It was responsible for 177 cases and 64 deaths a mortality rate of 36 2 per cent women were much more seriously affected than men the rate for the former being 70 per cent against only 30 per cent for the latter

From 1933 to 1937 28 cases (with 17 deaths) of post-vaccinal encephalitis were notified in Norway One case of this complication was notified from the Punjab in a Hindu baby of 11 months

Other matters with which the Permanent Committee concerned itself included the control of vitaminized products periodic medical examination and the issue of health record cards various communications on mental hygiene cancer and other subjects and reports on typhus dengue dysentery tuberculosis malaria psittacosis and tularaemia In all more than one hundred papers and communications were received and considered

JUBILEE OF INTERNATIONAL CONGRESS OF PHYSIOLOGISTS

The jubilee of the Physiological Society founded in 1876, was celebrated by a most interesting personal history of its members and proceedings written by Sir E Sharpey-Schafer, published as a supplement to the *Journal of Physiology* and reviewed at length by Sir John Rose Bradford in these columns (1928, 1 313) The International Congress of Physiologists first met at Basle in 1889, but as the arrangements were made in 1888 the Congress to be held this year at Basle may be regarded as the meeting of the jubilee, and has been commemorated by an admirable history of these triennial congresses by Dr K J Franklin of Oxford[1] The idea of an International Congress of Physiologists was originally put forward by Gerald F Yeo professor of physiology at King's College London, and honorary secretary of the Physiological Society from its start until 1889 This at once received a warm welcome from Michael Foster, then at the zenith of his influence, Burdon Sanderson of Oxford Schafer of University College, Purser of Dublin, Rutherford of Edinburgh, McKendrick of Glasgow and Gaskell of Cambridge, who circularized their Continental colleagues with such success that the Congress in September 1889, had a membership of 180 The main objects of the Congress were exchange of ideas mutual friendly criticism and opportunities of making personal acquaintance with other physiological workers Foster, to whom formality was a crime (Sherrington), was very active in establishing a happy atmosphere at the congresses thus anxious to make the meetings as informal as possible he sat himself down in the front row at the opening session of the first congress and rather ostentatiously, as he afterwards confessed smoked his pipe He carried his colleagues with him in agreeing that the proceedings should be characterized by the greatest simplicity, and that feasting receptions, and official addresses should be barred Communications were to be usually limited to fifteen minutes and preferably to take the form of demonstrations A good example in this respect was set at the first congress by von Mering and Minkowski's production of diabetes mellitus by pancreatectomy by Mosso who showed his ergograph Goltz who brought his decerebrate dog and Beevor and Victor Horsley's operative skill in demonstrating the motor functions of the cerebral cortex in the monkey

Except during the war the congresses have met every third year, successively at Liege Berne Cambridge Turin (1901) where Foster, the perpetual honorary president had a remarkable ovation Brussels Heidelberg Vienna Groningen (1913) Paris (1920) Edinburgh Stockholm Boston Rome, and at Leningrad and Moscow (1935) where Pavlov was president 485 communications were made and more than 1 300 members were present Dr Kenneth Franklin has accumulated and most skilfully arranged an enormous amount of interesting matter about the congresses has collected from the eleven survivors of the first congress details which otherwise might have been lost and has affectionately dedicated what he modestly calls A Short History of the International Congresses of Physiologists to Charles Scott Sherrington one of the general secretaries of the congresses from 1892 to 1907 who by his experimental demonstrations at successive meetings and by his personal encouragement of younger physiologists has for half a century put into practice the principles laid down by the founders of the congresses

ROCKEFELLER TRAVELLING FELLOWSHIPS

The Medical Research Council has awarded Rockefeller Fellowships to the following for the academic year 1938–9

Richard Raymond Bomford B M M R C P Assistant Physician London Hospital

Thomas Colver M B M R C P Out patient Medical Registrar, Hospital for Sick Children Great Ormond Street London

Robert Morton Heggie M B Assistant Lecturer in Pathology and Bacteriology the Welsh National School of Medicine Cardiff

Ian MacKenzie M B F R C S Ed Assistant Surgeon St Giles's Hospital London

George Geoffrey Evanson Smyth M D M R C P Dickinson Research Scholar National Hospital Queen Square, London

Ivor Glyn Williams, M B F R C S D M R E Senior Assistant Radiotherapist Meyerstein Institute of Radiotherapy Middlesex Hospital

All the Fellows propose to work at centres in the United States with the exception of Dr Smyth who intends to study in Paris Dr Williams will hold his fellowship for six months only

In addition the Rockefeller Foundation has awarded fellowships on the recommendation of the Medical Research Council to the following candidates in the special field of psychiatry, neurology and related subjects

Thomas Russell Cumming Fraser M B M R C P Assistant Medical Officer Maudsley Hospital London

William Walters Sargant M B Medical Officer Maudsley Hospital London

Michael John Francis McArdle M B M R C P Assistant Medical Officer Maudsley Hospital London

The friends and pupils of Dr Louis Ombredanne professor of orthopaedics in the Paris faculty of medicine are proposing to offer him a medal engraved by M Charles Pillet on the occasion of the thirtieth anniversary of his professional instruction The presentation will be made at 11 a m on October 6 at the Hopital des Enfants Malades Subscriptions should be sent to M Georges Masson 120 Boulevard Saint Germain, Paris

Local News

SCOTLAND

Health of Edinburgh

The annual report of Dr John Guy, who is retiring from the position of medical officer of health for the City of Edinburgh, contains a review of the work of the public health department during the twenty-five years in which he has been associated with it The gross expenditure in 1913 was £37,618, in 1937 it had risen to £432,489 In the former year there were only two assistants to the medical officer of health, at the present time there are fifty-two full-time assistants in the department which also uses the services of fifty-nine part-time medical men The total staff in the department twenty-five years ago was 490, to-day it is 1,570 Twenty-five years ago there were no schemes for the treatment of tuberculosis and venereal disease, no child welfare schemes, and no school medical services The death rate from all forms of tuberculosis in 1913 was 1 9 per 1,000 and last year 0 8, a reduction of 58 per cent, or a saving of 441 lives The child welfare department was started in 1917, when the infant mortality rate was 127, to-day the rate has fallen to 70, representing a saving of 421 infants The venereal disease department was instituted in 1919, and the examination of school children about the same time Medical examinations of school children have increased from 23,641 to 100,645, and children under treatment from *nil* to 53,840 The report of the chief sanitary inspector states that the attitude of the people to sanitary requirements has now entirely changed from one of apathy and obstruction to a widespread desire for reform During the past twelve months 474 families have been removed from overcrowded houses to corporation houses, while in fifty other cases of overcrowding the inhabitants have been transferred to better private dwellings Since 1923 the local authority has dealt with 6 650 insanitary houses affecting a population of 22,069 A scheme was adopted by the local authority in 1934 to prevent the transference of infested furniture to new houses During the year the furniture of corporation tenants has been inspected, and it has been found that in 32 per cent of cases the furniture was bug-infested The Department has paid special attention to the smoke nuisance and the railway companies have taken measures to prevent the emission of smoke in the city

Montessori Congress

A Montessori congress attended by delegates from various European countries and America and by Dr Maria Montessori, was held in Edinburgh during the week ending July 30 Dr H Crichton Miller spoke on the subject of the changing responsibility of the teacher The three great things to a young child, he said, were security valuation and freedom, and the Montessorian principles promoted these Parents in all directions were failing in the great responsibility of providing them, and the burden fell upon the teacher Dr Montessori gave a series of four lectures in which she pointed out that a child's education should begin at an early age and that the child was guided along certain lines by his inner needs and also by the help of adults Environment had a stimulating effect on a child and his problem did not call for a negative policy of reducing studies The child in development passed through certain phases which had to correspond to relative phases in education She had devoted special attention to the first period of development from birth to 6 years when the child was passing through a formative period from a biological point of view During this time the child discovered a valuation of his personality, which came from finding that he could do things for himself It was necessary, therefore, to put him in a free environment where he could make his own social contacts This freedom was not freedom to do anything that he liked but freedom to do anything that helped him The child of 7 years changed completely, became less attractive, wanted to know many things, and developed feelings towards the abstract parallel with those towards the concrete which he had in the first phase He now needed greater independence, and had a need for more rigid environment with wider social contacts An example of social response to this need was found in the organization of the boy scouts The third phase was that of adolescence, when the social sense developed in the individual Some of the failures of the secondary schools were due to the use of mnemonic methods, which were no longer adapted to development at this stage In all walks of life discipline was necessary Freedom and discipline were two things which should go together, and if discipline was lacking in a class there must be some defect in freedom The teacher must not be an authoritarian person, but at the same time he must not be a passive and negative person

Edinburgh Foot Clinic

At the annual prizegiving on July 28 of the Edinburgh Foot Clinic, Sir William M Kechnie, who presided, expressed great satisfaction at the recognition of schools of chiropodists accorded by the Representative Body of the British Medical Association at its meeting in Plymouth He said that this would be a good thing for the Society of Chiropodists, and also a good thing for hundreds of thousands of people in this country Dr Lechmere Taylor said that forty years ago chiropody was unknown to the medical profession, and it never occurred to a doctor that a patient might with advantage be sent to a chiropodist This branch of public service had now achieved a reputation and a status which was very satisfactory Mr T M'Walter Millar remarked that a very full investigation had been made into the status of the Edinburgh school by the chairman of the Hospitals Committee of the B M A, and he considered, speaking as a surgeon, that it was well that the previous decision of the Representative Meeting had been rescinded

ENGLAND AND WALES

Welsh Board of Health's Report

The report of the Welsh Board of Health for 1937-8, which has just been published as part of the annual report of the Ministry of Health (H M Stationery Office, Cardiff, price 5s), reviews in detail the many-sided activities of the Department It includes separate chapters dealing with public health, public assistance, national health insurance, and contributory pensions, and these throw interesting light on the steady development of the Department and of the public health and social services of the country A new feature which is likely to prove of value to students and administrators is the presentation, in one table, of the principal vital statistics of the country over a number of years This table shows the remarkable decreases which have occurred in both the birth rate and the death rate since the beginning of the twentieth century Whereas in 1901 there were 63,233 births in a population of just over two millions, in 1937 there were only 37,175 in a population of nearly 2½ millions, in other words, the birth rate has declined from 31 3 to 15 per thousand of the population, or by more than 50 per cent, since 1901 During the same period the death rate has decreased by 42 per cent, from 18 1 to 10 5 per thousand While the infant mortality rate has undergone little change during the past four years, the 1937 rate of 63 per thousand live births, compared with 135 for 1911 and 161 for 1901,

indicates a considerable improvement since the beginning of the century One of the most gratifying features in the report is the reduction in the maternal mortality rate from 6 61 per thousand births in 1934 to 4 54 in 1937 which is the lowest rate shown in the table The report calls the attention of public health authorities to the problem of the high death rate from cancer which for the last four years has exceeded 1 per thousand of population—a figure substantially in excess of the tuberculosis death rate

MATERNITY AND CHILD WELFARE TUBERCULOSIS

The domiciliary service of salaried midwives under the Midwives Act 1936 is now generally speaking in operation throughout Wales The number of midwives employed in the new service at the end of 1937 was 702 and they had up to that time, attended 13 684 cases (including 3,316 maternity nursing cases) The report shows that increasing use is being made of the facilities provided for both ante natal and post natal examinations During 1937 over 17 000 women attended clinics for ante natal examination and nearly 1 700 mothers attended for post natal examinations either at post natal or ante natal clinics Forty authorities in Wales provide the services of consultants under their maternity arrangements, and during 1937 such services were provided in ninety eight cases where assistance was sought by a general practitioner

The decline in the mortality from tuberculosis which has been a feature of recent years was checked slightly in 1937 but the rate for that year of 0 862 per thousand of population is the lowest but one yet recorded for Wales and shows a fall of 43 per cent compared with the figure of 1 508 for 1911 which is the earliest year for which comparable figures are available The King Edward VII Welsh National Memorial Association, which carries out the treatment of tuberculosis in Wales on behalf of the county and county borough councils, received £295 000 from the contributing authorities in respect of the year 1937–8 The Minister's scheme for the third fixed grant period (1937–42) has been amended to provide for payment of £337,675 in lieu of £301 000 for 1938–9 This amendment was made in view of the increases in the cost of provisions, coal materials and other items The working of the arrangements for the prevention treatment and after care of tuberculosis in Wales has been the subject of investigation by a Committee of Inquiry appointed by the Minister of Health and composed of Mr E Clement Davies, K C, M P (Chairman), and Dr F J H Coutts, C B

Bristol Health Services

A report relating to the extension of the Bristol Health Services has been adopted by the City Council This document is the work of a committee which received reports and recommendations from the Health and Education Committees on three matters (1) the appointment of additional health visitors and school nurses and an amended scale of salaries for such officers, (2) the appointment of additional assistant medical officers, and (3) a revision of the salary scale for nursing staffs in the hospitals

The report states that the work of the health visitors has grown considerably in recent years The staff is now responsible for supervision of the three nursery schools and the seventeen classes premises to accommodate eight more classes are being erected Supervision of the provision of meals for mothers and infants is undertaken at four centres mentally defective children under 5 years of age are also supervised while the recent extension of the City boundaries has also added to the volume of work

With respect to the school medical services this work increased enormously between 1929 and 1934 the comparative figures being

	1929	1934
Number of visits to school	2 135	2 431
Number of examinations	107 050	139 061
Number of visits to houses	9 177	15 407

In accordance with directions from the Board of Education a complete review of the school medical services was made in 1936 The survey scheme which has been adopted in certain parts of the City of Bristol provides for the examination of every child attending school and if a child is not progressing mentally or physically the case is referred for special examination by a doctor Much of the work now undertaken by the nurses obviates examinations by doctors and in this way cost are reduced An indication of the good result of early and regular examination is given by the increased number of children referred for eye examination in 1934 before the survey commenced 2 998 children were referred for eye examination in 1937 the number had increased to 3 911 It is now desired to extend the survey scheme to the whole of the City and to allocate a special nurse for ear testing for deafness Attendances of children at health centres have increased from 22 915 in the March quarter of 1937 to 35 212 in the corresponding quarter of 1938

As the result of propaganda the ordinary work in connexion with ante natal clinics and infant welfare centres has increased since 1931 provision has had to be made for five additional ante natal sessions and sixteen infant welfare sessions weekly health visitors are also working in the voluntary infant welfare centres to the extent of five additional sessions weekly while the introduction of post natal work has resulted in a further ten sessions weekly The Health and Education Committees recommend that the present staff of fifty be increased by the appointment of fourteen additional health visitors and school nurses eight being for health services and six for school services The committees also recommend that the scale of salary for these officers be revised including special provision for sisters in charge at health centres The Health Committee has recently approved an extension of these part time medical services by six sessions a week while nursery schools and classes will be further extended by six sessions per week diphtheria immunization also occupies one session a week

The Health and Education Committees have recommended that they be authorized to appoint two additional whole time medical officers In addition to the sessions mentioned above ten sessions a week are held by part time doctors in connexion with the school medical service

For some time the Health Committee has been concerned with problems relating to the recruitment of probationers and the retention of trained nursing staff in the hospitals under their control The problem has recently become much more acute and it is now very difficult to obtain nurses Various measures have been adopted to meet the situation including the introduction of a scheme for the training of girls and filling the gap between the time girls leave school and the age at which they are eligible to start as probationer nurses and by the appointment of male nurses and orderlies and female attendants to undertake certain duties formerly performed by nurses The shortage of trained nursing staff appears to be due mainly to the unattractive rates of remuneration The shortage is not confined to Bristol it is the same in other areas where girls are able to find better paid employment with shorter hours of work and the opportunity of living at home The Health Committee recommends that the scale of salaries for nurses in the institutions under its control be revised

---

E Pouch (*These Paris* 1938 No 125) records thirty illustrative cases of recurrent chancres of the penis in which there was an interval ranging from three months to twenty years between the appearance of the first and the second chancres Five cases were examples of three successive chancres In each case the reappearance of a chancre was due to a fresh syphilitic infection Although it was impossible to prove that the patients were cured of their syphilis the new chancre appeared only in persons whose previous disease was attenuated as shown by an absence of nervous and visceral symptoms and an almost invariably negative Wassermann reaction In no case did the nature or duration of treatment seem to have had any influence on the appearance of the second chancre

Correspondence

Pelvic Measurements

SIR,—I read with great interest the leading article, ' Are Pelvic Measurements Worth Taking? ' which appeared in the *Journal* of August 6 (p 291) The writer, I imagine, like myself, rather regrets the necessity for further elaboration of mechanical devices for purposes of diagnosis, I fear however, it is inevitable in all branches of medicine in which they are applicable It certainly is so in respect of pelvic radiography Only by means of x rays is it possible to measure the pelvis with mathematical exactness, although, admittedly, the obstetrician of experience can by means of his hands and callipers, predict with a surprising degree of accuracy whether or not a foetal head will pass through a pelvis of abnormal formation The best I could secure was 6 per cent to 10 per cent Caesarean sections in the cases in which I deemed it probable that the child would pass—in other words, in the cases in which I permitted a trial of labour Certainly some children are lost in "trial labour," but very few if it is judiciously employed

In one period of three months in the Royal Maternity Hospital, Glasgow, the late Dr Shannon, Dr Fraser Lee (Edinburgh), who was at the time my house-surgeon, and I lost not a single mother and only one mature child (prolapse of cord) It was one of my most interesting clinical experiences Our object was to determine what could be secured in cases of recognizable pelvic malformation by rational conservative measures and Caesarean section judiciously selected Day and night Dr Shannon or I went to the hospital and discussed with our house-surgeon the procedure that should be employed Incidentally, can you wonder that I am a supporter of staffing a maternity hospital with a Master, as is the custom in the Rotunda Hospital, Dublin, and that I advocate that obstetric practice should be, so far as circumstances and the locality will permit, in the hands of obstetric experts (well trained specialists and general practitioners interested in obstetrics)?

There is no objection nor is there any hardship involved, in making it a routine practice to have a pelvic radiograph taken of every primigravida The suggestion that the measurements should be engraved on her wedding ring emanates I doubt not from minor critics of a like kidney to those who in times past held up antiseptics to scorn, scoffed at the employment of rubber gloves, and criticized the use of masks

What, it may be asked are we going to gain with a perfect radiograph of pelvis and foetal head? Will it permit us to dispense with a ' trial of labour ' in borderline cases? I fear that dream can never materialize Adjustments of head to pelvis moulding of head and the efficacy of the driving forces cannot be predicted Consequently a trial of labour will always remain an accepted procedure The radiograph will help the experienced obstetrician to select his cases with more exactness, and especially if he employs in addition intrapartum radiography should this be deemed advisable in a particular case It is interesting to note that in some of the most modern hospitals in which pelvic radiography has been extensively employed there is a decline in the number of Caesarean sections That might be the outcome in this country The danger that the incompetent or *amoral* obstetrician who freely employs Caesarean section will "get away with it" and pursue his nefarious trade is a passing danger Sooner or later, like other wrongdoers he will be brought to justice To hasten such a desirable issue what about making the mode of delivery notifiable on all intimations of birth? That would be rather a nasty blow to him

In my opinion maternity practice, in so far as circumstances and the locality will permit, should be entirely in the hands of obstetric experts—well trained specialists, and general practitioners interested in obstetric practice Only by these means can we ever appreciably reduce the maternal death rate and the neonatal death rate Much has been written in respect of the former, and I make bold to predict that very soon the seriousness of the continued high stillbirth and neonatal death rates will cause alarm Several thousands of children are being lost annually by *bad* obstetrics With a falling birth rate can this unsatisfactory state of matters be allowed to continue?—I am, etc,

Canterbury, August 11 J M MUNRO KERR, M D

Trial Labour The Plastic Head

SIR,—I was greatly interested to read your leading article "Are Pelvic Measurements Worth Taking? in the *Journal* of August 6 (p 291) It is still not widely appreciated how easy it is to acquire the technique of cephalometry, and how useful and reliable are the results The success of "trial labour" depends on several factors, one of which, the efficiency of the uterus, can never be foretold It is, however, quite certain that it is an unjustifiable risk to attempt trial labour if the true conjugate is known to be less than, say, 3 5 inches It is also certain that it is unjustifiable to induce labour without exact measurement of the foetal head It is not suggested that a successful outcome is impossible in such circumstances, but that the risks to mother and child are far greater than with Caesarean section The serious decision to allow delivery to take place by labour in a case of known contraction of inlet or outlet demands accurate knowledge of the size of the head Induction performed at a selected date assumes that the date of term is known, and this is far from true The case for induction in minor degrees of contraction depends upon knowledge of the size of the head, and in this lies the supreme value of cephalometry

In a maze of uncertainties it is heartening to have one fact to cling to, and I suggest that it is a fact that a foetal head with a bi-parietal diameter of 3 6 inches or less is always plastic and will mould, if necessary during labour, to a grotesque extent If left to term the bones may be hard, and gross overlap will be necessary, with a knife like edge to lacerate the maternal tissues and the certainty of foetal injury With a true conjugate of, say 3 5 inches and a bi-parietal diameter of 3 3 inches there would be almost a certainty of a living child, while a more mature foetus with a diameter of 3 5 inches could be extracted, probably living, but certainly without damage to the mother

There are now large collections of cases which show that induction of labour by rupture of the membranes performed through an antiseptic medium such as 10 per cent dettol in glycerin, does not raise the figures of morbidity, and I believe that if this method be adopted, with careful measurements and keeping the concept of the plastic head in mind, the whole question of trial labour will be raised from the level of inspired guesswork to on of an attempt to deal scientifically with a difficult problem

With regard to induction by rupture of the membranes I have been sorry to read of a number of ingenious

instruments designed to puncture the membranes and withdraw fluid This practice is likely to bring the whole method into disrepute for I am certain that it is not the withdrawal of liquor which is mainly responsible for starting labour, but the tearing of a considerable hole in the membranes and the resulting contact of the foetal head with the uterus without the intervening membranes We have all seen cases in which spontaneous leakage of large quantities of liquor amnii has failed to start labour for many weeks but after an experience of over 250 cases I have yet to see a failure where a hole of an inch or two has been made even if it is effectually plugged by the head and the escape of liquor is negligible My own technique is to pinch up a fold of the membranes with a forceps applied to the side of the head and with a finger to tear through the fold enlarging the hole as much as possible It is quite unimportant how much liquor escapes

Measurement of the pelvic inlet is now firmly established, but the outlet is usually ignored or measured by elaborate methods There is a simple way of obtaining useful information on this point to which I have seen no reference If a film be taken in the sitting position as described by Rowden Orley and others at a focus film distance of 30 inches the tips of the ischial spines are clearly seen projecting into the pelvic oval If the distance between these tips be measured and ½ inch subtracted to correct for magnification, any serious degree of contraction of the outlet can at once be detected The normal direct measurement on the film is about 5 inches and if it be reduced below 4·25 inches spontaneous delivery at term is highly improbable

If attention be given to these factors—the inlet the outlet, and the plastic head—I believe that Caesarean sections early and late will be greatly reduced and that many of the tales of the horrors of labour will go out of circulation —I am, etc

Bexhill on Sea August 6 NORMAN REECE

Quinsy and its Treatment

SIR,—Ever since 1899 I have performed tonsillectomy on the first appearance of oedema of the palate or anterior pillar By dissecting the anterior pillar off the tonsil from below one never fails to open the abscess In 1922 I sent a letter to the *American Journal of Laryngology* stating I had performed this operation at least once a week for twenty three years with no deaths Since that date I have had one death but it was due to the anaesthetist using chloroform instead of ether while I was washing my hands we got the patient round but he died about an hour after the operation was finished In thirty nine years I must have operated on over 2 000 cases I have had two or three close shaves, but a stab laryngotomy saved the situation It seems that ether occasionally increases the oedema of the septic laryngeal condition and so blocks air entry In thirty two years at the Children s Hospital I saw only one or two cases a year In twenty-three years at the Royal Melbourne Hospital I always had one case and sometimes three or four, a week

Cocaine and its derivatives are in my opinion quite useless and by no means harmless I have had six cases of severe oedema of the glottis, in two of them the patients died—one as mentioned above and one hospital patient who refused operation The latter had pus in the pericardium It seems to me wicked to let a patient suffer agony for days while waiting for the abscess to point Some of my early cases must have inspired pus but no unhappy consequences followed Double quinsy is not common, and in the few cases I have had both tonsils were removed If the patient is not seriously ill I always remove both tonsils as I have frequently seen quinsy supervening in the other tonsil In these cases there must be some anatomical peculiarity allowing entrance of septic material into the intratonsillar fossa which the patient is unable to extrude —I am etc

Stelnach II Operation for Prostatic Enlargement

SIR —I am very interested in the notes of Lieutenant-Colonel T Hunter s two cases of prostatic obstruction successfully treated by the Steinach II operation (August 13 p 376) All that I had intended to convey in my article published in the *Journal* of July 9 was that a critical attitude must be maintained to this operation owing to the fact that the patient suffering from obstruction frequently showed a temporary and spontaneous remission of symptoms a remission for which the Steinach operation might receive the credit I did not deny that favourable results had been obtained and I think that one may regard Lieutenant Colonel Hunter s cases as examples of these I sincerely hope however that he will keep these patients under observation and let us know the sequel Unfortunately, I have had to carry out a subsequent prostatectomy on several cases on which I had previously performed a Steinach operation the amelioration of symptoms only proving temporary Lieutenant-Colonel Hunter does not state whether he noticed any reduction in the total mass of the prostate as felt per rectum after his operation I suspect that although clinically the patients were much improved, the prostate still remained enlarged —I am etc

London W 1 August 12 KENNETH WALKER.

Subvesical Diathermy Prostatectomy

SIR —I am naturally glad to find that I have the support of so experienced a urologist as Mr Terence Millin in advocating the need for sparing the trigone when performing perurethral prostatectomy (*Journal* July 30 p 239) At the same time I do not think that this is generally recognized, for an examination of current literature including the illustrations will show that many surgeons undoubtedly consider it necessary to remove a large portion of it If Mr Millin will experiment with the instrument which I employ I feel sure he will find that it is possible to undercut the trigone from within the urethra not only posteriorly but also laterally with considerable accuracy Therefore the risk of recurrent obstruction due to a ball valve mechanism seems to me to be no greater than after prostatectomy by enucleation whether this be performed by the suprapubic or the perineal route —I am etc,

London W 1 August 12 R OGIER WARD

Undescended Testicle

SIR —Mr Denis Browne is of course correct in his contention that many people are unaware that most cases described as an undescended testicle lying in the inguinal canal are really examples of superficial inguinal ectopia but he flogs the point to excess and is certainly grossly unfair in the suggestion given in his letter in the *Journal* of August 13 (p 374) that most examiners are ignorant of this knowledge

Although it may be a bright ray of light to many people, and doubtless even to some examiners, I think I should say that Mr C H Figge who was an examiner well known at the Royal College of Surgeons for many years, used to teach this point consistently in the wards at Guy's Hospital I learnt it from him close on fifteen years ago, and I do not doubt that he had been teaching it for many years before this and had asked many questions on the same point at the College During the last five years I have always made it a special point to bring this question up during the final Fellowship course held at Guy's Hospital—I am, etc,

London, W 1, August 13 R C BROCK

Sulphonamide Chemotherapy in Gonorrhoea

SIR,—There are certain points in your annotation "Chemotherapy in Gonorrhoea" (August 6, p 294) which we feel require comment

First we hope that your question "which of the available compounds is the most effective and how it should be used" is largely answered by an article published in the current number of the *Lancet* (August 13) In this article we analyse the results of 633 followed-up male and female cases of gonorrhoea treated with sulphanilamide, we have also treated to date more than 150 cases with uleron and more than 100 cases with 2-(*p*-aminobenzenesulphonamido)pyridine (M & B 693)

Our views on the effects of uleron in gonorrhoea have already been stated Any extensive experience with followed-up cases will show it to be markedly less effective in all stages of the disease than either sulphanilamide or M & B 693, although in isolated cases its effect appears to be little short of miraculous We cannot, however, agree with your implication that uleron is a more toxic substance than M & B 693, or for that matter than sulphanilamide The occurrence of five examples of peripheral neuritis is practically the only toxic effect observed in our 150 cases, though admittedly of more serious significance than most others Neither is it our experience that "excessive dosage does not appear to be a factor in producing this condition"

Our experience suggests that M & B 693 is probably as effective as sulphanilamide in gonococcal infections, but not more so It is, however, by no means as free from toxic effects as your annotation might lead one to suppose In fact, in our cases M & B 693 has produced a proportion of toxic manifestations similar to that seen with sulphanilamide, these being if anything, more pronounced It would be interesting to hear the opinion of other workers who have used this drug in a similarly large number of cases of both sexes

Finally we feel that Dr H M Hanschell's letter in the *Journal* of August 13 (p 375) may give an erroneous impression of both the efficacy and non-toxicity of uleron Unfortunately his claim that uleron has proved more effective than sulphanilamide is not supported by figures and is therefore possibly based on immediate results only Where uleron fails is to produce an adequate proportion of *final* cures and we feel that if Dr Hanschell's cases could be followed up for three months his claim would not be substantiated Similarly the remarkable freedom of his cases from uleron neuritis might also be attributed to the fact that most of his patients are seamen who may have developed their neuritis *after* their return to sea—We are, etc

A J COKKINIS

Lavage for Gonorrhoea

SIR—How refreshing it was to read in Dr F J T Bowie's article on this subject (*Journal* August 6, p 283) that a V D specialist had treated and cleared up six cases of acute gonorrhoea without artificial urethral lavage! One only regrets that Dr Bowie prescribed lavage in the other twenty-four cases, "mainly for psychological reasons" perhaps Dr Bowie would tell us whether these were to keep the patient attending or to ease his own conscience!

There are many physiological reasons against lavage by artificial methods, thus (1) The point of entry of the infection is the meatus, whence it spreads backwards—syringing in the same direction can only tend to increase the rate of spread and decrease localization (2) No antiseptic short of a caustic can reach and destroy the *intracellular* diplococcus (3) The pressure of syringing, however slight, may certainly dislodge surface debris (casualties), but this is forced into the crypts and glands of the urethra (dugouts), where the gonococci (wounded only, maybe) may recover and multiply for a fresh and more penetrating invasion of healthy tissue (4) A cardinal principle of the treatment of inflammation is *rest*, on this basis the trauma of syringing is contraindicated

A good psychological reason against syringing is the patient's hatred of the paraphernalia and discomfort of the whole business, in many cases he can ill afford the time or money for fares to attend a clinic for this treatment The result is that co-operation is prejudiced, and the patient may neglect treatment because it is worse than the disease

Physiological lavage can be obtained by instructing the patient to drink at least four quarts a day of lemon barley water (so easy to make nowadays), and giving him (or her) pyridium, caprokol, or some other urinary antiseptic Combined with rest, preferably in bed for a week or more, with a diagnosis of "inflammation of the waterworks," this treatment has given good results for twelve years, but it would appear that the introduction of disulphanilamide will relegate the morbidity of acute gonorrhoea to that of the common cold if physiological principles are observed in treatment—I am, etc,

Greenford, Middlesex, August 13 ALISTAIR FRENCH

Mental Factors in Medicine

SIR—Dr T A Ross has raised one or two points of considerable interest and importance in his paper on the mental factors in medicine in the *Journal* of July 30 (p 209) He indicates, for example, the difficulties that exist in teaching students the art of clinical psychology Obviously the direct and public methods of examination which are effective in the ordinary medical and surgical case will not be applicable to the neurotic The question, "What are you complaining of?" is merely to be regarded as the opening gambit, and detailed investigation can only be done in private Discussion of the case can be carried out after the patient has left the room, and obviously, on account of the incomplete insight obtainable at this stage will have to be concerned with theoretical possibilities of structure and interpretation rather than with any definite problems that have been elicited Skill in technique can only be obtained by experience, but a good theoretical grounding is necessary for at least all of the more radical forms of psychotherapy

A particular difficulty Dr Ross appears to have is in deciding who is the right and proper person to be allowed

to give instruction in the neuroses He does not like the psychiatrists and he mentions three rather formidable obstacles in the way of making physicians and surgeons teachers of the subject On the whole he seems to prefer the neurologists So far as the psychiatrist is concerned he asserts that there is nothing in his study of insanity which will lead him to understand the neurotic mind more fully than will a man brought up in general medicine This remarkable statement will be read with astonishment by the ordinary psychiatrist who as part of the daily round the common task has to deal with such symptoms as depression, anxiety agitation obsessions and conversion phenomena to mention a few which are the common features of the neuroses I should have thought without going into further detail that Dr Bernard Hart's well known *Psychology of Insanity* has been for long a standing refutation of this argument

Finally is not Dr Ross in objecting to the neuroses being looked upon as a specialty protesting to high heaven against the inevitable? As he himself admits specialization is taking place more and more in medicine and the signs surely indicate not only that it is bound to continue but that owing to the piling up of knowledge it will before very long become impossible for a student to qualify in medicine surgery, and the associated subjects within anything like a reasonable period of time He will therefore be compelled to specialize on certain subjects before qualification If this is part of the march of events it behoves us to make the best of psychotherapy as a specialty even if the psychiatrists have to take a hand in it!—I am, etc,

London, W 1 August 11 FREDERICK DILLON

Maternal Mortality and Medical Education

SIR—The education of general practitioners in midwifery was criticized by Dr Summerskill member of Parliament for West Fulham in the recent debate on health administration in the House of Commons The House had received from the Minister certain figures which indicated that the maternal mortality for England and Wales was 3 13 per 1 000 during 1937—the lowest rate ever recorded Dr Summerskill expressed her indignation at this rate for what is supposed to be a normal physiological process, and somewhat inconsistently declared her opinion that every woman undergoing this normal physiological process should go into a hospital for her confinement - Because she herself as she explained in great detail had taken her qualification in medicine (M R C S, L R C P) with no other practical experience in midwifery contributed by her school than that obtained by simply being in a room where twenty confinements were conducted without going near a bed or touching a patient she assumed that that is a universal experience, and that consequently general practitioners so trained should not be allowed to go out and attend confinements because it is a kind of confidence trick played on the mothers They believe that every doctor is fully qualified

That there is a difficulty in obtaining adequate midwifery experience for the medical student must be admitted and it is not altogether clear how the new regulations requiring increased midwifery experience to come into operation in November 1938 can with the existing accommodation be actually carried out demanding as they do a period of two months attendance in a maternity hospital or maternity wards of a general hospital with residence in the hospital or in a hostel attached thereto The Labour Party to which Dr Summerskill belongs has materially increased this difficulty by the objections it has raised from time to time to the system of education of the medical student in midwifery which obtains in London and other great cities by which the student is enabled to visit parturient women in their own homes and conduct labours on his own responsibility always backed by immediate accessibility to the highest specialist skill inasmuch as he can call upon the whole of the obstetric staff of a great hospital when he is in difficulty How well this system has worked in London is I think evident from certain figures which I obtained some time ago on the rate of maternal mortality in the districts served by the great teaching hospitals the average rate having been returned as under 2 per 1 000 The profession however I think must be prepared for a drive to provide more maternity hospitals or at any rate many more maternity beds and in this connexion I would like to say a word about a particular voluntary effort to provide such accommodation which has not in my submission received the support and commendation it richly deserves

With Lord Snell then Chairman of the London County Council I was privileged to speak at the annual meeting of the Salvation Army Mothers Hospital in Whitechapel a few weeks ago (May 28) I was surprised to learn and I think my readers will be surprised to hear that this hospital founded some twenty five years ago is the second largest maternity hospital in London Started at first to receive unmarried mothers in whom the maternal mortality is highest of all the enterprise has been sustained chiefly upon voluntary gifts and contributions from patients Of an income for the last financial year (1937) of £19 930 only £5 500 was contributed by public authorities (the Ministry of Health and the London County Council) in respect of the maternity and V D work rendered The rest of the income was derived from annual subscriptions and occasional gifts (£2 101) nurses and probationers fees (£1 814) King Edward's Hospital Fund (£950) fees from patients (£9 243) and funds derived from local entertainments and other voluntary efforts to raise money

Over an average of three years—the births being 1 543 in 1935 1 596 in 1936 and 1 595 in 1937—the rate of mortality was 2 3 per 1 000 a remarkable achievement in view of the fact that there was in those years a great preponderance of primiparae nearly twice as many as the multiparae and a large proportion of unmarried mothers in whom mortality is always high

Associated with and attached to the hospital are homes for mothers and infants district nursing centres a school for midwives (for the hospital is recognized by the Central Midwives Board as an institution for training midwives) pre natal and ante natal clinics In addition to the in patient activities the hospital conducts an extensive out patient service Thus for the year 1937 there were over 21 000 attendances at ante natal clinics 7,500 attendances at child welfare clinics 2 500 attendances at post natal clinics There were further 750 births in the district with 20 800 visits Countess Baldwin recently opened a new isolation wing which we were able to inspect very fully on our visit It provides single-ward accommodation with verandas for twelve patients two nurseries and a very up-to date and scientific installation for sterilizing

This admirable institution seems to me to present a typical example of the genius of the English people for voluntary service which they carry out so much more successfully, as a rule than any form of State service Unless voluntary institutions of this kind are now multiplied and adequately supported to meet the need there can be little doubt that the much more expensive and much less efficient State service desired by the Labour Party will be imposed upon us—which God forbid!—I am etc.,

Ramsgate August 4 E GRAHAM LITTLE.

Abdominal Pregnancy

SIR,—In his interesting article on this subject in your issue of June 18 (p 1301) Mr Ronald Reid has discussed the stage at which operation should be undertaken In India with the uneducated females one cannot choose one's time for any operation, but has to be thankful that permission to operate at all has been granted Consequently it is not surprising that in neither of the two cases I have seen in the last three years had the patient consulted a doctor before finally coming to hospital with abdominal tumours each of which is described in the case notes as being the size of a seven and a half months pregnancy

Both were nulliparous One was aged 20 married six years and had had normal periods until a year previously, the other aged 25 married fourteen years had also had normal periods until a year previously For twelve months both had had amenorrhoea and steady enlargement of the abdomen but no pain The less stupid of the two said she had felt flickering movements in the tumour eight months previously and that for the last three months it had decreased in size She had also noticed changes like those of pregnancy in her breasts but the other woman had noticed nothing except a slight vaginal discharge for two days shortly before admission

In both a diagnosis of extra-uterine pregnancy was made, the one being confirmed by a radiograph which showed a full-term foetus lying transversely though in the second case as the result of a negative screening report the operation was listed as an exploratory laparotomy In the former case my colleague Rao Bahadur Dr Onkar Singh, removed an almost full term dead foetus complete with membranes and placenta which were extremely adherent to omentum and adjacent structures while my laparotomy revealed a disorganized mass the basis of which was a foetus of perhaps six months This also was very adherent but was finally removed *in toto* together with the left ovary to which it was fixed and the remains of the left tube, from the centre of which it had originated

Both patients made uneventful recoveries and were discharged within three weeks blissfully ignorant of the dangers of haemorrhage and peritonitis but keenly intent on doing their duty by producing a living male child on the next occasion—I am, etc,

Jodhpur India July 26 E W HAYWARD

Small-pox and Vaccination

SIR,—Dr C Killick Millard's letter in the *Journal* of July 16 makes me think I, too, may be out of touch 'with current views of those most familiar with the questions of the aetiology and prophylaxis of small-pox' The views expressed by Dr Millard may be quite right for Leicester and even England *now that small-pox has been almost extinguished* but surely it would be unwise to generalize such views might be misunderstood by persons in different circumstances thus causing them to run serious risks For instance residents in Leicester are quite safe from wolves now that wolves have been exterminated unless they escape from a menagerie or zoo, and even then they are at once reported and searched for till they are caught But people living where these animals abound are wise to take precautions against them Is it not so with small-pox?

I have been in medical practice as a missionary about forty years in China—thirty years in the interior where small pox abounded and still does to a less extent, and latterly on the coast where it also occurs In the interior I can remember meeting only two adult unvaccinated Chinese who had not developed small-pox and one of them would not "take" when vaccinated more than once On the other hand, there was a large and increasing proportion of people who had been vaccinated and had never contracted the disease As to foreigners—that is, non Chinese—a friend of mine who for conscientious objections would not have himself or his family vaccinated was badly marked by the disease and lost two of his three children who also developed it I could mention other similar cases I and my five brothers were all vaccinated in infancy, and though we were brought up until about the age of 10 among the Chinese, who neither notify nor segregate their infectious diseases, we have never contracted it

In the school for foreign missionaries children, of which I have been medical officer for several years, most of the 2,000 children educated there during these fifty odd years were brought up in similar surroundings until they came to school, and, having been vaccinated, have not contracted small-pox, with perhaps very few exceptions Four years ago the Chinese servant, who in the preparatory department of that school sees to the wardrobes and is always in and out of the bedrooms, developed the disease He did not mention it until the third day, after having handled all the clean Saturday laundry He was sent home I revaccinated the whole staff, servants, and scholars, over 100 persons, and nobody developed the disease We thought that, apart from special prayer vaccination saved them, and also the other members of their families who reside in inland China and are frequently exposed

Perhaps Dr Millard, while condemning vaccination or compulsory vaccination in England, would recommend it for those residing abroad May I, as a medical man, at present on furlough, in a large Mission which has about 1,000 members actually in China, nearly all in the interior, living among the Chinese with their own children and their Chinese co-workers, ask Dr Millard what he would advise them to do instead of vaccination? Up to the present we have relied on this, and almost this alone, and found it to be almost an absolute preventive We dare not abandon vaccination until we have a more sure, or as sure a prophylaxis, and shall be glad to hear of one

May I add that in the above mentioned school we think we have practically prevented the occurrence of diphtheria for years by inoculation, but there are a few parents who have refused it Vaccination is compulsory in our Mission and in this school, and I think the only case of small pox among the scholars for many years—probably twenty or thirty—has been the son of the conscientious objector already referred to, who was a day scholar—I am, etc

FRED H JUDD, M B

China Inland Mission, London, August 6

Purpura from Sedormid

SIR,—In view of your annotation on thrombocytopenic purpura from sedormid (July 30, p 229), the few cases described in the literature, and the letter of Dr F E Loewy in your issue of August 6 (p 320), the following would seem to be of interest

On March 4 1938 I was asked by a colleague to see a patient of his a woman of 26 years, on account of her having severe epistaxis and continuous oozing of blood from the gums This had begun suddenly and had been continuing for several hours When I saw her she was extremely pallid with thirst air hunger a subnormal temperature, and a very rapid pulse rate The bleeding was most difficult to control in spite of thorough packing of both nostrils with gauze soaked in viper venom and the giving of the usual remedial agent including vitamin C Where these had been given hypo-

dermically extensive bruising occurred Later there were purpuric spots over the whole body and bleeding from all mucous membranes

The case was one of pulmonary tuberculosis just commencing artificial pneumothorax treatment in a nursing home where she had been since February 11 From that day till the day I saw her she had received two sedormid tablets every night As I had read of purpura from sedormid in Price's *Medicine* where it is actually indexed under this heading we decided this might be a possible example The drug was not given again A platelet count was not done The patient gradually recovered She has had no further haemorrhage nor was there any previous history of purpura She had amenorrhoea from February to June

—I am, etc,

West Worthing August 7 H IVOR BALFOUR

Abortion and the Law

SIR,—If the intention underlying the recent case of Rex v Bourne was to reveal an unsatisfactory state of the law with a view to securing amendment, I cannot see that this object has been achieved Rather the reverse the principle behind the law—the tacit understanding that the parties shall act in good faith—has been emphatically reaffirmed Surely this is the one essential point the very crux of the matter, upon this point alone rests the justification for surgical intervention whatever the circumstances

The law (I think wisely) does not attempt to confine its position within narrow limits, however carefully legislation were framed it would certainly from some points of view involve oppressive restriction or permit irresponsible abuse To lay down hard and fast rules for general application would be virtually impossible without entailing individual hardship Circumstances alter cases, there are wide divergencies of legitimate opinion ranging from the view, backed by professional and religious opinion that therapeutic abortion is never justifiable in any circumstances to the opposite extreme view referred to by Dr C A H Franklyn (*Journal* August 13 p 373) that no woman should be forced to become a mother unless she is willing and anxious so to be; in other words, that a pregnancy which is unwanted is a pregnancy which should be terminated Professional, moral and social arguments can be advanced to support either of these extreme views or to justify any shade of intermediate opinion Where such a wide range of considered opinions exists no view can be wholly condemned as wrong or exclusively upheld as right each contains some germ of truth The point at issue is, Where in practice does intervention become justifiable?

No rigid rule is I think, possible or even desirable, no single criterion is sufficient in itself Thus, for example I cannot believe that every pregnancy originating from rape should *ipso facto* be terminated nor every pregnant woman below a certain age refused the chance to bear her child for that reason alone By all means let these factors be considered but in proper proportion to the other circumstances of the individual case The responsibility is a grave one and there is much to commend the established practice of sharing it between responsible persons preferably with special experience to guide them

The recent trial has not solved all the difficulties but it has simplified them by widening the scope of the issues at stake It has now been judicially approved that we are entitled to take into consideration in determining whether to advise the termination of a particular pregnancy not only immediate risk to the life of the mother but also wider dangers to her bodily and mental health This is nothing really new for it lays down more clearly than ever the general principle that whatever our personal opinions may be the law requires us to consider each case on its own merits to exercise reasonable skill and care in forming our decision to take every factor into consideration in its proper proportion and above all to act in good faith Individual decisions may be very difficult but the law is content that we should act honestly and for the best according to our lights

I think this is the real answer to Dr Franklyn's suggestion that the course of the trial was neither logical nor consistent Admittedly issues were raised—sentimental moral and professional—which were never fought out to their logical conclusions I do not think many of the issues were capable of conclusive decision—*quot homines tot sententiae* but I think it is fair and just to base a professional opinion upon them all taken together much as it is both logical and consistent to base evidence in any other type of criminal trial on circumstantial evidence no part of which is capable of absolute proof or refutation but which gathers force from the way it hangs together and points consistently in one direction only I do not pretend that it is an infallible system but it is the best that can be done, and it is an established method of legal procedure

I hardly think it is a fair comment to suggest as Dr Franklyn does that Mr Bourne made his decision on sentimental moral and sympathetic grounds and justified it in court on medical grounds Even if this were so, I feel it would have been both logical and consistent but all aspects of the case were discussed in court and laid before the jury I do not attach much importance to Dr Franklyn's contention that Mr Bourne made his decision before seeing the patient The essential features of the case—her age the fact that she was pregnant and her unfortunate story—required no further demonstration Moreover I think I am right in stating that the decision was not finally made until the results of his clinical examination had excluded the danger of infection

To sum up I think it has been clearly demonstrated that the law neither encourages nor forbids therapeutic abortion it recognizes that it may be necessary as a surgical operation and as such requires it to be performed skilfully by properly qualified persons activated by reasonable motives The law cannot be expected to provide us with a rule of thumb to relieve us of individual responsibility—I am etc

Lincoln August 14 ALLAN H BRIGGS

Hygiene of Sea Bathing

SIR,—In the *Journal* of August 13 (p 367) I am reported to have said He advised women not to bathe in the sea the day before and the first day *after* menstruation whereas what I did say was that I advised women not to bathe the day before or on the first day *of* menstruation Otherwise I entirely agreed with Dr Doreen Nixon that sea bathing during menstruation was generally harmless, provided that a favourable reaction followed the bathe

The same principle is involved when deciding whether any persons should indulge in sea bathing It depends upon the individual's reaction If a favourable reaction follows the bathe sea bathing may be continued If an unfavourable reaction follows sea bathing is contraindicated At the same time it is well to point out that it is possible in probably the majority of persons to gradually convert unfavourable reactions into favourable ones by simple hydrotherapeutic procedures—I am etc,

Torquay August 13 K R COLLIS HALLOWES

London Emergency Bed Service

SIR,—Recently I was called to a case of ptomaine poisoning a mother and child of 3 years, in addition there was a 2 months old baby (not infected) The mother and child were in need of urgent hospital treatment I rang up King Edward's Fund Emergency Bed Service and explained the case within fifteen minutes I was informed that a suitable hospital would accept the cases and also admit the baby for care while its mother was in the hospital! Such service cannot be too highly praised I had anticipated an hour's telephoning to try to get the two cases into hospital, I hardly dared to hope to find a hospital willing to care for a normal baby during its mother's illness I feel every practitioner should know of this excellent service.—I am, etc,

PROPHYLACTIC ANTI-TETANIC INOCULATION

The issue of the *Royal Army Medical Corps Journal* for May 1938, included a comprehensive paper by Major (now Brevet Lieutenant-Colonel) J S K Boyd of the Department of Pathology, R A M College, on active immunization against tetanus

The work recorded was undertaken at the suggestion of the Director of Pathology to explore the possibility of introducing active immunization against tetanus as a routine measure in the British Army Major Boyd found that the standard of immunity given by the well-spaced two dose system compared favourably with that achieved by other methods, and it is believed to confer adequate protection for a considerable period of time Recommendations were accordingly made to introduce this method on a voluntary basis for all Regular troops An announcement on the subject has been made by the War Office Press Bureau and an Army Council Instruction is issued on inoculation against tetanus with tetanus toxoid

PROCEDURE

The procedure follows the same principles as those that have been so successfully applied in the prevention of diphtheria It consists of two subcutaneous injections, each of 1 c.cm of tetanus toxoid given at an interval of six weeks No unpleasant after effects are produced by the toxoid Within a few weeks following these inoculations defensive substances develop and persist in the blood these effectively neutralize the toxin of the tetanus bacillus It is not necessary to repeat the injections since the protection lasts for many years Officers and men will be encouraged to take advantage of this simple method of securing protection To avoid interference with the normal duties of serving soldiers the inoculations will be undertaken after the training season Recruits will be inoculated during recruit training the first dose being given when the recruit attends for vaccination Tetanus toxoid will be issued in bottles of 50 c.cm and 10 c.cm a record of the injections being made in accordance with Regulations for the Medical Services of the Army Although the reaction after inoculation is very slight it is advisable that no active exercise should be taken for twenty four hours

DEATHS IN THE SERVICES

Surgeon Commander HENRY BAKER HALL R N (ret) died in the Royal Naval Hospital, Plymouth, on July 16 aged 72 He was educated at Edinburgh University where he graduated M B C M with first class honours in 1891 He entered the Royal Navy in 1892 and attained the rank of surgeon commander on May 11 1908 On the outbreak of war in August 1914 he became fleet surgeon in H M S *Challenger* and took part in the Cameroon Expedition He returned to England in 1915 and was invalided from the Service Later he became one of the medical officers for recruiting in Plymouth, and afterwards served as medical officer for the Ministry of Pensions in London and Bristol He became a member of the B M A in 1921 and had long associations with Plymouth

Lieutenant Colonel WILFRID BURRELL THOMSON R A M C (ret) died at Alverstoke Hampshire on July 19, aged 81 He was born in Burma on June 7 1856, and was educated at Sheffield and St Mary's Hospital He took the M R C S Eng and the L R C P Ed in 1881 entered the Army as surgeon on July 29, 1882 became lieutenant colonel after twenty years service and retired on June 7 1911 After his retirement he was employed for some time from 1912, at Northampton

Correction.—The late Lieutenant Colonel J C Gordon Carmichael R A M C (ret) was born on August 27, 1878 and not on the date mentioned in our obituary notice published on August 6

Universities and Colleges

UNIVERSITY OF LONDON

At a meeting of the Senate held on July 20 it was announced that Sir Cooper Perry had been reappointed by the King in Council as a member of the Court for a further period of five years from October 1

Recognition of Teachers

The following have been recognized as teachers of the University in the subjects indicated in parentheses *Guy's Hospital Medical School* Mr H J B Atkins (Surgery) Mr Arthur Bulleid M R C S L R C P (Dental Surgery) *Middlesex Hospital Medical School* Mr C P Wilson (Oto rhino laryngology) Mr W R Winterton (Obstetrics and Gynaecology) *St Mary's Hospital Medical School* Dr G F Buchan (Hygiene and Public Health), Mr J F Simpson (Oto rhino-laryngology) *King's College Hospital Medical School* Dr J C Hoyle (Medicine), Mr E G Muir (Surgery) Mr J H Peel (Obstetrics and Gynaecology) *King's College Hospital Medical School and Maudsley Hospital* Dr S Nevin (Medicine) *London School of Hygiene and Tropical Medicine* Dr J J C Buckley (Tropical Medicine) *Maudsley Hospital* Professor W E Le Gros Clark (Anatomy) Dr A F Tredgold (Mental Diseases)

Grants

Grants were made out of the Central Research Fund the Dixon Fund, and the Thomas Smythe Hughes Medical Research Fund for 1938–9 to the following A W M Ellis (professor of medicine at London Hospital Medical College), C A Lovatt Evans, F R S (Jodrell professor of physiology at University College) W J Hamilton (professor of anatomy at St Bartholomew's Hospital Medical College) Samson Wright (John Astor professor of physiology at Middlesex Hospital Medical School) R J O Connor (demonstrator in anatomy at University College) W H Newton (reader in physiology at University College) D H Smyth (lecturer in physiology at University College) G Stella (lecturer in biochemistry at University College)

Amendment of Regulations

Amended regulations were approved for the second examination for medical degrees for internal and external students It was resolved that in and after 1940 candidates for the second examination for medical degrees who have passed in Part I of the second examination for medical degrees under former regulations be required to take the biochemistry portion only of the paper and practical examination in organic chemistry and biochemistry Copies may be obtained on application to the Academic and External Registrars

The regulations for the examination for the academic postgraduate diploma in public health (*Red Book* 1937-8 p 651) were amended as follows

(i) By the substitution of the following for the first fifth and sixth paragraphs on page 651 Part I of the examination will consist of two papers and practical and oral examinations in the subjects of Part I of the course Part I of the examination will be held twice a year beginning on the Monday of the week prior to that in which Christmas Day falls and on the first Monday in April or if that be a Bank Holiday on the second Monday in April Part II of the examination will be held three times a year beginning on the last Monday in June on the fourth Monday in September and on the first Monday in January

(ii) By the inclusion in the seventh paragraph of November 21 as the latest date for the receipt of entries for the December examination

(iii) By the inclusion of the following approved areas in which candidates may receive the prescribed instruction in public health administration (see last paragraph of revised regulations approved in December 1937 to which reference is made in the *London University Gazette* of February 9 1938 pp 87 and 90) the Royal Borough of Kensington the Metropolitan Borough of St Marylebone and the Borough of Willesden The regulations for the external diploma in public health (*Blue Book* September 1937 pp 1005–9) were similarly amended

It was resolved that in and after 1939 the examination for the academic postgraduate and external diplomas in clinical pathology should be held in the week beginning on the first Monday in October instead of the second Monday in December and the regulations (*Red Book* 1937-8 p 616 *Blue Book* September 1937 p 1105) were amended accordingly

Medico-Legal

A NURSE IS A WORKMAN

Under the Workmen's Compensation Acts a workman is anyone who enters into or works under a contract of service The Court of Appeal has often been called on to consider whether certain classes of workers—for example professional footballers film stars and Salvation Army officers—are entitled to workmen's compensation for injury In Wardell v Kent County Council[1] a trained nurse acting under the direction of a ward sister was preparing a poultice of antiphlogistine it exploded in the can in which it was being heated and caused her injury She applied to the county court judge at Maidstone for an award of compensation but he held that she was not acting under a contract of service but under a contract to perform services as an independent expert She appealed to the Court of Appeal who decided by a majority of two to one that she was a workman and was entitled to compensation There was much argument whether Hillyer v St Bartholomew's Hospital with its distinction between the skilled technical duties of a nurse and her ministerial or administrative duties could be applied to the present case Lord Justice Greer thought that it could and that when she was doing her work as a nurse the hospital governors were liable neither to pay damages for her negligence nor to compensate her as a workman His two learned brethren however disagreed Lord Justice Slesser considered that her contract of service could not be divided and that although the hospital authority might from time to time choose the person under whom this nurse was called upon to obey she was always under obedience to them Lord Justice Mackinnon also considered that the negligence cases could not properly be applied to the question at issue "In fact so manifestly are nurses in the service of their hospital he said, that for that very reason it is necessary in a negligence case to inquire whether the hospital is liable for their negligence The nurse is the servant of the hospital for general purposes and is under a contract of service with them within the Workmen's Compensation Acts The court therefore sent the case back to the judge to assess the compensation payable They also gave the council leave to appeal to the House of Lords and as the decision will affect all the hospitals and many thousands of nurses the case may well be argued before the supreme tribunal in due course

Obituary

SIR COLIN MACKENZIE

A correspondent in Canberra sends the following personal memoir of Sir Colin MacKenzie founder and first director of the Australian Institute of Anatomy supplementing the obituary notice published in the *British Medical Journal* of July 9 (p 99) The photograph of Sir Colin was taken while he was at work in the Institute in 1934

The death of Sir Colin MacKenzie removes from the medical profession in Australia one of its best known and most picturesque personalities Of pure Highland descent he was a piece of Scotland transplanted to Australian soil In appearance generally, and especially in the contours of his head the Celtic strain was distinctly marked His death at the age of 61, when at last he might have expected to reap some harvest from the unremitting toil of his early years, was a misfortune For more than twenty-five years he had worked to consolidate his ideal of an Institute of Comparative Anatomy dealing mainly with the Australian fauna The cup was dashed from his lips almost before the magnificent building at Canberra, with its two large museums containing his anatomical dissections and specimens, had been fully completed MacKenzie's anatomical work was always his only hobby, and he found no time for relaxation in games etc A steady increase in blood pressure, after several warnings resulted in a major cerebral haemorrhage

Colin MacKenzie belonged to that very small group of Australian medical men whose writings and medical work are known beyond the borders of the island continent Although well past its first centenary, Australian medicine is still in tutelage to Europe and to America The Australian textbooks of medicine surgery midwifery etc have yet to be written for use in Australian medical schools Some independence of thought has already emerged, but it can hardly be said that so far the influence of Australian ideas or discoveries on world medicine has been profound MacKenzie joins that select band of Australian workers whose names include Bancroft of Brisbane Hamilton Russell and Dunhill of Melbourne Elliot Smith, Harris, and Hunter of Sydney As might only be expected at this early stage of her history the contributions to medical literature of a definitely original character which have emanated from Australia have been comparatively few The gravitational pull of the large medical centres in Great Britain has always resulted in a steady loss from Australia of some of the best products of her medical schools It is in England that their mature work is undertaken and published, and Australia loses the credit of their achievements Although Sir Colin MacKenzie visited England on four occasions and America three times yet he always returned to his home land with his devotion to it unimpaired His intense loyalty to Australia accompanied by his devotion to ideals which would advance his native country and especially add to its scientific standing in the eyes of the world was almost a passion with him.

William Colin MacKenzie had an unusual career which divided itself into three parts He graduated to a

professorship of comparative anatomy in the Government of the Commonwealth from the ranks of general practitioners of medicine, with an intermediate period as a specialist in orthopaedics The youngest of six children, and the third of four sons to be educated for the profession of medicine at Melbourne University, he was born at the small old-fashioned Victorian township of Kilmore, about forty miles from Melbourne He completed his course, taking first-class honours in medicine and surgery, within a few weeks of his twenty-first birthday Three years of resident posts at metropolitan hospitals followed, fitting him for general practice, which he began in 1901 near the gates of the Melbourne University He had previously been appointed demonstrator of anatomy at the Medical School, and later on he was to become lecturer in surgical and applied anatomy A further early appointment which was to determine the main lines of his career for many years was that of clinical assistant to out patients at the Children's Hospital, Melbourne Here he became greatly interested in the treatment of the deformities following upon infantile paralysis Although this was a narrow field of specialism he was later able to make it a lucrative one, and to make important discoveries in it

In 1904, despite the exigencies of a growing general practice, he found time to sit for the degree of master of surgery of the Melbourne University His attempt was unsuccessful, and after spending some time in the study of the German language he determined to visit Europe This was a momentous decision which was to have a profound influence upon his professional work and future career On his way to Edinburgh he visited Heidelberg to work with Professor Vulpius, a well-known orthopaedic surgeon After obtaining the Fellowship of the Royal College of Surgeons of Edinburgh he went to Liverpool to investigate the practice of the conservative school of orthopaedics founded in that city by the famous Hugh Owen Thomas and carried on by his brilliant nephew Robert Jones Returning to Melbourne impressed by the operative work on tendons being performed by Vulpius, and greatly influenced by the principles of muscle rest and muscle recovery then being enunciated by Robert Jones he proceeded to put this new learning into practice At that time (1905) knowledge of the various new splints then being used at Liverpool and of the basic ideas which underlay their use in treatment of muscle pareses, was possessed by comparatively few in Australia Soon after his return the Melbourne Children's Hospital was faced with a severe epidemic of infantile paralysis The treatment of the recent and remote effects of this disease became, as his writings testify, the dominant influence in his mind for many years

MacKenzie was not a slavish copyist of other men's work and ideas He was an innovator, and suffered a great deal of misunderstanding and adverse criticism of his work the results of which were sometimes doubted, especially in Melbourne In consequence at one period before the great war he became somewhat embittered and solitary in his professional life In the special work on infantile paralysis he was although greatly influenced by Thomas, Vulpius and Robert Jones, continually attempting to improve upon their methods In the surgery of old cases of poliomyelitis his aim was always to relieve the weak muscle groups by tenotomy of the tendons of the overacting muscles followed by adequate anatomical rest and accompanied by re-education of function in the overstretched paresed muscles He did not do any transference of tendons In early treatment before the onset of crippling deformities and the need for surgical intervention he for some time followed the lead of Robert Jones by splinting the overstretched weakened muscles in the position of relaxation and hoping for recovery by rest Gradually he went on from this point and, not content to wait until relaxation by itself produced recovery he evolved his well known theories relating to muscle re-education These were ultimately embodied in the textbook now used so freely in massage and muscle re-education departments of hospitals, *The Action of Muscles including Muscle Rest and Muscle Re education* Although so well known to-day, the original conceptions of this departure in treatment were revolutionary at the time He was the first to use the special term "muscle re-education," and to depart from the rigid rules regarding continuous rest until recovery which had hitherto been followed His most striking advance was to stress the great importance of the action of gravity in all educational attempts to regain muscle function after paresis of any nature The idea of the minimal load, the zero position for recovery, and the use of the smooth powdered surface of board or cardboard for re educational muscle work were advances which must always be associated with MacKenzie's name Sir Arthur Keith, in his review of orthopaedic surgeons and their methods, given in his book *Menders of the Maimed* accords MacKenzie full credit for this definite advance in the treatment of weak muscles

For some years before the great war MacKenzie had relinquished general practice and specialized as an orthopaedic surgeon in Collins Street, Melbourne He rapidly built up an extensive practice, mainly dealing with tuberculous joints and the deformities following upon paralyses In the intervals of practice he embarked upon an investigation of the special anatomical problems associated with the structure of the native fauna of Australia These were afterwards to play a predominant part in his life A fervent admirer of John Hunter's work and principles the idea germinated in his mind that he might possibly found in Australia an Anatomical Museum, which would deal principally with the Australian monotremes and marsupials, and attempt to correlate functional adaptations and structural change As his plan developed he saw comparative anatomy as a stepping-stone to surgery, and his dream eventually was to make the Institute of Anatomy at Canberra affiliated with the Royal Australian College of Surgeons and comparable to the Hunterian Museum at Lincoln's Inn Fields

It was during an early dissection of the deltoid region in the koala (*Phascolarctos cinereus*), illustrated in his article on infantile paralysis (*British Medical Journal* February 24, 1917), that he became especially interested in the functional powers of such a well developed and differentiated muscle Function and structure as the two essential correlations of life were constantly in MacKenzie's mind and inspired his work Watching the koala in its native environment, he carefully observed its capacity of raising the arm and hand above the head For a long time he had been worried by the bad results which followed upon a severe attack of infantile paralysis affecting the muscles of the shoulder girdle and upper arm The wasted almost absent deltoid, with dropped head of the humerus, flail shoulder-joint, and dangling arm had become a nightmare to him Out of these observations and anxieties was born the acute realization of the damaging gravitational effect of the weight of the arm and its ultimate preventive—the deltoid or upper arm abduction splint for use in all cases of upper arm paresis After careful inquiry I have no doubt that MacKenzie was the originator of this splint, his abduction splint was featured in his writings in 1908 The splint itself, with full explanation, was sent to an orthopaedic congress and exhibition of splints held at Bologna, Italy, in that year

For several years before 1914 MacKenzie devoted all his spare time to dissections of the unique Australian animals I have vivid recollections of days spent in active orthopaedic practice, with every evening and every week end devoted to unravelling the anatomical structure of the platypus koala wombat, echidna, etc A battered old copy of Richard Owen's incomparable work on the *Comparative Anatomy of the Vertebrates* was our inseparable companion in this work At the outbreak of war a valuable collection of dissections had been accumu

lated Leaving for England early in September 1914 to join the R A M C I took with me the manuscript of Colin MacKenzie's first article to be published in England This was The Treatment of Infantile Paralysis A Study in Biology An interview with the Editor of the *British Medical Journal* Sir Dawson Williams in the old office in the Strand resulted in publication of these results of eight years work on this subject on January 9 1915 I was also entrusted with a mission to Sir Arthur Keith at the Royal College of Surgeons Museum to ascertain if room could be found for MacKenzie on the voluntary staff A very gracious reception resulted in MacKenzie coming to England with many of his specimens for the Museum early in 1915 and working with Sir Arthur especially on the cataloguing of war specimens for two years Realizing early in 1917 the urge to do some active surgical work in connexion with war injuries he consulted me about the possibilities of obtaining employment at the special Orthopaedic Military Hospital at Shepherd's Bush London Having obtained an interview with Sir Robert Jones on his behalf I was able to complete arrangements for a muscle re education department to be established there with MacKenzie in charge as a voluntary worker In order to counteract enemy propaganda against British hospitals he was requested by the War Office to write a lengthy article on Military Orthopaedic Hospitals showing their scope and details of work This was published in the *British Medical Journal* of May 26 1917 During that year also he wrote *The Action of Muscles* It was a great pleasure for me to collaborate in the manuscript of this work and to go over every detail of the text with him When MacKenzie returned to Australia at the end of 1917 I arranged publication with Messrs H K Lewis and corrected the proof sheets The reprint, which was required in 1919 was entrusted to me as editor *The Action of Muscles* was an immediate success in England and many copies were also sold in America Some of the statements aroused controversy, but nearly all the criticisms were laudatory and the value of the exposition of the principles of muscle re education has never been questioned

After the conclusion of the war MacKenzie devoted himself more and more to comparative anatomy His collection of Australian faunal specimens eventually became too great to be housed and maintained by any private individual Negotiations were opened with the Commonwealth Government for its acquisition as a gift to the Australian people These were successful and culminated in 1924 in an Act of Parliament by which the Government of Australia undertook to house and maintain the dissections at Canberra and agreed to appoint the donor first director with what amounted to a life tenure of the position Soon after this had been accomplished Colin MacKenzie was rewarded by the honour of knighthood In 1930 the collections were transferred to Canberra and have since been housed with many other substantial gifts in the two spacious well lit museums attached to the Australian Institute of Anatomy This beautiful building occupies a commanding position in the new Federal capital The museums are well patronized by the public they will be a lasting memorial to the vision and genius of one who loved Australia and its heritage with all his being

Dr CLAUDE ALFRED HEATH GEE who has died at the age of 61, was an old student at the Bristol General Hospital, and after qualifying in 1899 and holding a resident appointment there he began practice at Evercreech Somerset He took the M B B Ch degrees of the University of Bristol in 1911 The war found him a very busy practitioner but the claims of service in the field proved irresistible and as soon as he could arrange for his work to be carried on he joined the R A M C and served in France as a battalion medical officer for one year and in Salonika for two years After the Armistice he resumed general practice at Evercreech Dr Gee had always been interested in dermatology and in 1923 he sold his practice went to Portbury to live and joined the staff of the Bristol General Hospital as assistant to Dr Kenneth Wills In 1927 he was appointed physician in charge of the skin department at the Children's Hospital and held that appointment at his death He built up a considerable reputation as a dermatologist and his kindness and skill will long be remembered among a large circle of patients and colleagues Dr Gee joined the British Medical Association in 1912

News has been received from Grenada British West Indies of the death of Dr G N ALEXIS on June 22 at the age of 67 Dr Alexis was one of the oldest and most respected members of the Grenada Branch of the British Medical Association and was very regular in his attendance at meetings He will be greatly missed by his fellow practitioners of the island At the annual scientific meeting of the Branch held on June 25 before proceeding with ordinary business a resolution was passed placing on record the deep regret of the members at his death and tendering sincere sympathy to his family The honorary secretary carried a wreath from members at the funeral which was attended by many other medical colleagues Dr Alexis joined the Association forty four years ago

The late Dr LOUIS WILLIAM LA CHARD who was for many years Commissioner of Police coroner and magistrate in Northern Nigeria did not start medicine till the age of 53 and some years after his retirement from the Service After studying in Vienna and St George's Hospital he took the L M S S A in 1937, and that year was appointed a medical officer to the Leeward Islands, where he *died on July 21 six weeks after landing* To go through the medical curriculum at his age required courage and perseverance and his friends will regret that he was not given a longer opportunity of showing his worth in the profession to which he had been attracted all his life

We regret to announce the sudden death on August 7 of Dr ALFRED GELSTHORPE OSBORN one of the best-known medical practitioners in Windsor, where he had worked for over thirty five years A student of Guy's Hospital, Alfred Osborn graduated M B Lond in 1899 and B S in 1902 between which years he served as house-surgeon and clinical assistant at Guy's and house physician at the Hospital for Sick Children in Great Ormond Street At Windsor he held many appointments medical officer to St Andrew's Hospital, Clewer, honorary medical officer to H R H Princess Christian's Infant Nursery police surgeon and medical officer and public vaccinator under the Berks County Council He was also a member of the Eton College Medical Board Dr Osborn joined the British Medical Association in 1919 and was an active member of the Windsor and District Medical Society He served with a temporary commission as captain R A M C during the war and afterwards was county commissioner for the St John Ambulance Brigade

The death took place on August 6 in an Edinburgh nursing home of Dr ALEXANDER SHEARER who was a well-known personality in the North and West of Scotland Born in Glasgow Dr Shearer took a medical course in the University of that city where he graduated M B, C M in 1894 He afterwards settled in Auchtermuchty where he engaged in general practice for a number of years before receiving an appointment under the Highlands and Islands Medical Services Board some twenty years ago When this Board was merged in the Scottish Board of Health and later in the Department of Health for Scotland Dr Shearer continued his work as Medical Officer for the Highlands and Islands The important development of the medical services which has taken place of late in the North and West of Scotland has been brought about

largely as the result of his energy, planning, and administrative ability, and this recently received official recognition by the award of the O B E He was highly popular both among his colleagues in the Department of Health and with the officials and people in the remote islands with whom his inspecting work brought him into contact Dr Shearer was a member of the British Medical Association, which he joined in 1903 He is survived by a widow and daughter

Mr ARTHUR STANLEY BARLING who died on August 8, was the senior magistrate for Lancaster and a past-president of the Royal Lancaster Infirmary He was born at Belle Grange, Windermere on November 11, 1863, the son of John Barling and received his education at the Leeds Grammar School and the Yorkshire College After obtaining the M R C S diploma in 1886 and the L R C P in the following year he was house surgeon and house-physician at the General Infirmary at Leeds for twelve months, and senior house-surgeon at the North Staffordshire Infirmary, Stoke on-Trent, from 1889 to 1893 He then settled in practice at Lancaster, becoming surgeon to the borough and county police and the fire brigade, district medical examiner for the Admiralty, and surgeon to H M Prison at Lancaster Castle He was for many years honorary surgeon to the Royal Lancaster Infirmary, and on retiring from the active staff was elected consulting surgeon Mr Barling joined the British Medical Association in 1889 and for many years was a prominent figure in the North Lancashire and South Westmorland Branch, serving as honorary secretary from 1904 to 1913, and president 1915–19, and again in 1922 , he had also been an associate member of the Border Counties Branch He wrote several papers on abdominal surgery

Dr ETHEL ROSALINE GRIFFITHS died in Hampstead on August 8 at the age of 61 While a student at the London School of Medicine for Women she won the prizes for chemistry and anatomy and the first Mackay scholarship, and graduated M B , B S Lond in 1911, taking the English Conjoint diplomas five years later The appointments she held included those of assistant resident medical officer at Lord Mayor Treloar s Cripples Hospital, Alton, assistant medical superintendent of Middleton-in-Wharfedale Sanatorium at Ilkley, and senior assistant medical officer to Cheshire Joint Sanatorium, Market Drayton Dr Griffiths joined the British Medical Association in 1929 and resigned at the end of last year owing to continued ill-health Her brother is Dr S A E Griffiths of Southfleet, Kent

Dr ERNEST JAMES MAXWELL *who died in retirement at* St Leonards-on-Sea on August 10, studied medicine at Cambridge and Guy s Hospital He graduated B A in 1890 obtained the English Conjoint diplomas in 1895, and took his M B and B Ch degrees in 1896 He had been a medical missionary under the North African Mission and medical officer to the Manchester Medical Mission and was for some time medical superintendent of the Eversfield Chest Hospital at St Leonards Dr Maxwell joined the Hastings Division of the British Medical Association in 1923

The death of Professor C E F RASCH on July 6 has evoked many memories of a man who at one time was Denmark s greatest dermatologist Born in 1861 he took care to broaden his postgraduate medical education on general lines for several years before adopting dermatology as his specialty One of his earliest works appeared in 1889 and dealt with the syphilitic arthropathies In 1902 he was put in charge of the dermatological polyclinic of the Frederiks Hospital and in 1906 he was attached to the University of Copenhagen first as a docent and later as professor It was mainly as a clinician that he made his mark and he did much to classify and throw light on the diseases of the skin of artificial origin It was no secret that he was the first to define that form of prurigo which is now commonly associated with the name of Besnier He also undertook pioneer work with regard to light dermatitis and certain hysterical skin diseases Much of his work on the mycoses was also original and he was courageous in his advocacy of large doses of salvarsan in the treatment of syphilis He will long be remembered as an inspiring teacher

Dr FREDERICK TILNEY a neurologist and neuro anatomist of international reputation, died on Center Island, New York, on August 7, at the age of 62 For some considerable time he had been in indifferent health Born in Brooklyn on June 4, 1876, he studied at Yale University and at Long Island College Hospital, where he took the M D in 1903 In the same year he went to Berlin to work under the neurologist Hermann Oppenheim At Columbia University he started his long and distinguished career with an appointment as instructor in anatomy in 1909, when he came into intimate contact with that master anatomist, George Sumner Huntington Five years later he became professor of neurology, and in 1931 was offered the medical directorship of the Neurological Institute, which had been moved to its new home at the Columbia-Presbyterian Medical Center in 1929 One of the greatest authorities of his day on the brain, Tilney was a prodigious worker and a prolific, elegant, and charming writer of books and articles which were published chiefly in the *Archives of Neurology and Psychiatry* the *Transactions of the American Neurological Association* the *Bulletin of the Neurological Institute* and the *Journal of Comparative Neurology* His book *The Brain from Ape to Man* is a neurological classic Criminology in its medico-psychological aspects was one of his favourite studies, and he devoted much of his time to the problems presented by juvenile delinquents In 1929 he delivered the Weir Mitchell Oration before the College of Physicians of Philadelphia, taking as his subject "The structural basis of behaviorism" His researches into the structural evidence of evolution in the brain of apes and man more than once led him into conflict with the Church He repeatedly pleaded for the establishment of a brain institute, which, as he told the New York Academy of Medicine in 1928, "liberally supported and effective, would prove an incomparably more profitable investment for civilization than the most powerful battle fleet that ever sailed the seas"

Dr HAROLD DICKINSON SENIOR professor of anatomy at New York University 1910–36, died after a prolonged illness in New York City on August 6, aged 67 Born at Croydon in 1870, he took the M D at Durham University in 1895 and in the same year obtained the Fellowship of the Royal College of Surgeons of England After serving as demonstrator of anatomy and as medical registrar at Charing Cross Hospital, he was appointed demonstrator in the anatomical department of the Medico Chirurgical College at Philadelphia in 1902 Before going to New York University he worked for some time at the Wistar Institute and at Syracuse University

Dr FREDERICK PETERSON ("Pai Ta-Shun"), who died in New York City on July 9 at the age of 79, was one of America's most eminent neurologists A connoisseur of the finer things in life, his collection of Chinese paintings was one of the most complete in the country, and of his poetry 'The Sweetest Flower that Blows' is widely known as a popular song

Dr POLYVIUS N CORYLLOS, director of surgery at the Sea View Hospital Staten Island New York, and formerly professor of clinical surgery at the Cornell Medical School died on July 26 at the age of 57 At one time Surgeon General in the Greek Army, in 1923 he went to America, where he specialized in thoracic surgery

Nova et Vetera

THE AFFAIR OF THE "1613" PRINTING OF JOHANNES RUMELIN'S "CATOPTRON"

This is the title of a scholarly and well illustrated article by Dr W B McDaniel[1] Librarian of the College of Physicians of Philadelphia and follows up the discovery in the College's Library of a copy of this rare first edition of Rumelin or Remmelin's (1588–1680) *Catoptron Microcosmicum* or Microcosmic-Mirror a set of three large folio size anatomical plates employing the device of superimposed flaps perhaps first suggested by Vesalius in his *Epitome* (1540) This first edition of the *Catoptron* has commonly been regarded as a plagiarism by the publisher Stephan Michelspacher of Ulm and Augsburg though Garrison (1929) briefly rejected this legend Dr McDaniel tentatively suggests that the perhaps unintentional originator of the reflection on the publisher's honesty was James Douglas who in his *Bibliographiae anatomicae Specimen* (1734) quoted from Rumelin's preface to the 1619 edition that he had not contemplated publication of the *Catoptron* but had

> fashioned it only for his own use in order to view many parts by means of a few and to call to mind a variety of facts through the aid of summaries but it so happened that the general talk of it among his friends caused the work to be wrested away from him for inspection and circulation until through their persuasion and at their expense it began to be published without his knowledge and so to be enjoyed like an unripe fruit but when he discovered that it abounded in defects and teemed with numerous intolerable errors made by the engraver and printer he again albeit unwillingly took up the work which he had designed 14 years earlier revised it and thus offered it in another dress

In 1931 Karl Schadelbauer pointed out that in 1615 Michelspacher in the dedication of a book to Rumelin made it clear that Rumelin gave permission for the 1613 edition to be published, but with singular modesty declined to allow his name to appear though his portrait and crest might well have given the reader the clue to the authorship After discussion of the reasons such as the occurrence of errors in the 1613 edition for Rumelin's conduct, Dr McDaniel concludes that the publisher should no longer be regarded as the villain of the piece, though no doubt both author and publisher were difficult customers It may be added that it is not unknown for the first edition of a book to be sent up as a *ballon d'essai* and then when success calls for a second edition for the author's name to appear on the title page as Samuel Johnson suggested in reference to the unauthorized editions of Sir Thomas Browne's *Religio Medici* (1642)

> a stratagem by which an author panting for fame and yet afraid of seeming to challenge it may at once gratify his vanity and preserve the appearance of modesty

---

One hundred years ago Charles Edouard Brown Sequard then aged 21 left his native town Port Louis on the island of Mauritius (at that time a French colony) where he had been a clerk in the general store to show his plays and novels to the literary critic Charles Nodier in Paris On receiving the shrewd advice to try a surer means of obtaining a livelihood such as medicine Brown Sequard after the bitterness of disillusionment had passed obediently embarked on a medical career which was to bring lustre to his name in France England and America Curiously enough at the same age Claude Bernard submitted his play *Arthur de Bretagne* to Saint Marc Girardin to have his literary ambitions crushed with the identical advice

Medical News

The fifty first annual conference of the Sanitary Inspectors Association will be held at Edinburgh from September 5 to 10 under the presidency of Sir Leonard Hill F R S The programme includes discussions on shell fish and the laboratory control of milk supply

The first meeting of French speaking microbiologists will probably be held in the middle of October at the Pasteur Institute Paris Further information can be obtained from Drs Pierre Lepine or Prevot Institut Pasteur 25 Rue du Docteur Roux Paris

The annual meeting of the Society of German Urologists will be held at Eisenach and not in Vienna as previously arranged from October 6 to 8 under the presidency of Professor Boeminghaus of Frankfort The subjects for discussion will be urology in infancy and early childhood nephritis nephrosis and nephrosclerosis the importance of allergy in urology relief of pain in urology and interruption of pregnancy on urological grounds Further information can be obtained from Dr Karl Heusch Rudolf Virchow Krankenhaus Berlin

The third Combined Congress of Tropical Medicine and Malaria will be held at Amsterdam from September 26 to October 1

The 250th anniversary of the birth of John Freke was mentioned in these columns on June 25 Sir D'Arcy Power tells us that John Freke's chandelier now hangs over the staircase of the Great Hall of St Bartholomew's Hospital it was removed from the steward's office some years ago and is opposite the Hogarth paintings for which Freke chose the figures from hospital patients

The July issue of *Surgery Gynecology and Obstetrics* is devoted to the memory of the late editor Dr Allen B Kanavel, whose death was announced in the *Journal* of July 16

Volume XVI of the *Guide to Current Official Statistics* has just been published by the Permanent Consultative Committee on Official Statistics It is a systematic survey of the statistics appearing in all official publications issued in 1937 and provides a ready means of ascertaining the nature of the information available on any subject and the official publication in which it is contained The *Guide* contains 406 pages and is obtainable from the sales offices of H M Stationery Office or through any bookseller price 1s (by post 1s 5d)

A map of the United States published in the *Journal of the American Medical Association* for July 16 shows that 98 5 per cent of the population live within thirty miles of a hospital

The June issue of the *Bulletin de l'Office International d'Hygiene Publique* contains articles on yellow fever psittacosis in Germany, England and Wales acute and chronic rheumatism in Italy and dental fluorosis in the United States An illustrated supplement is devoted to the prophylaxis of leprosy in the French Colonies

A Leverhulme Research Grant has been awarded to Dr Gerald E Friend for an inquiry into gain and loss of weight of 5000 boys in day and boarding school during term and holiday as a possible manifestation of fatigue

The membership of the newly formed London Manchester Medical Society is steadily rising but the committee is convinced that a considerable number of ex Manchester men in practice in and around London are still unaware of its existence The purpose of the society is to bring together old Manchester students and intending members are urged to communicate with the secretary Mr Albert Davis F R C S 93 Harley Street

Dr W E Thompson said to be the oldest practising physician in the United States of America celebrated his 103rd birthday on July 6 at Bethel Ohio Oddly enough poor health prevented him from entering the army as a surgeon during the Civil War

Frederick William Vanderbilt, grandson of Commodore Cornelius Vanderbilt, died on June 29 at Hyde Park, New York aged 82 A graduate of the Sheffield Scientific School at Yale University he gave millions of dollars for philanthropic purposes He helped to build the Sloane Hospital for Women in New York City and the Vanderbilt Clinic of the Columbia-Presbyterian Medical Center is named after him Retiring by nature, he had been in ill health for several years

For the first time in its history the Trudeau Medal of the National (American) Tuberculosis Association has been awarded to a woman, Dr Florence Barbara Seibert of the Henry Phipps Institute, University of Pennsylvania

The number of medical students in German universities has been restricted to 6 000 in Berlin 2 700 in Cologne, 4,800 in Munich, 2 500 in Leipzig 2 400 in Munster 1,700 in Hamburg, 1 600 in Frankfort and 600 in Dusseldorf

Dr Turchini, honorary electroradiologist to the Paris hospitals, has undergone his eighteenth operation for cancerous radiodermatitis

The first woman doctor in Persia has recently been qualified She received her medical education in Paris

By order of the President of the Turkish Republic the celebrated harem of Aga Ismail at Istanbul has been converted into an obstetrical clinic containing 200 rooms

The widow of Dr Chaboux, honorary physician to the Rouen hospitals has bequeathed 100,000 francs to the French Medical Association

EPIDEMIOLOGICAL NOTES

Poliomyelitis

During the first six months of 1938 the number of cases of acute poliomyelitis was higher than the corresponding figures for 1937 in England Germany and Hungary, while in most of the other countries of Europe and the United States fewer cases were notified than in 1937 The increase in England and Wales was observed in the early weeks of July the notifications for the four weeks ending July 9 16 23 and 30 being 7 (1) 9 (1) 30 (9) and 41 (8) respectively The figures in parentheses refer to the numbers notified in the county of Essex where the first outbreak of importance appeared In the week ended August 6 the figures rose to 61 (16) these cases were distributed thus Essex 16 (Braintree 8, Halstead 6 Chelmsford 1 Dagenham 1), Lincolnshire 10 (Grimsby 6, Administrative County 4) Glamorgan 6 (all in Swansea) Surrey 4 (Farnham 3 Beddington and Wallington 1) Sussex 4 (all in Worthing) Carmarthen 4 (Carmarthen 3, Kidwelly 1) County of London 3 East Riding of Yorkshire 2 (both in Kingston-upon Hull), Bedford 2 (both in Luton) Berkshire 2 (Reading 1 Easthampstead 1), 1 each in Cornwall Cumberland Derby, Durham Hertford Leicester Salop and Suffolk In Germany during the four weeks ended July 23 the figures reported each week were 35 38 40 and 62 respectively of these 62 cases, 11 occurred in Wurtemberg 8 in Saxony and 17 in Bavaria In Hungary of the 47 cases reported between July 17 and August 6 25 occurred during the last week of July including 9 in Szaboles Department and 5 in the Department of Jasz

Enteric Fever Small-pox

During the week under review the incidence of typhoid fever rose from 32 to 49 of which 24 (in 23 cases the disease was confirmed) belong to the Farnworth (Lancs) outbreak, in the week following 9 additional cases were removed to hospital and several more suspected cases were reported to the health authorities Another death in this week brings the total number to 3 Although the source of the infection has not been determined it is probable that the later notifications do not belong to the primary crop but have followed on infection derived from those already in hospital

During this same week also 3 cases of small pox were notified in the Urmston urban district (Manchester)

Diphtheria and Scarlet Fever*

Notifications of diphtheria in England and Wales during the week ending August 6 fell from 1,007 to 825, and in London from 154 to 113 There was a rise in the notifications for Scotland—126 as against 106—but in Eire an appreciable drop was noted—39, compared with 46 in the previous week in Northern Ireland on the other hand, there was an increase—20 as against 14 in the previous week Deaths from diphtheria in the 126 Great Towns of England and Wales fell from 19 to 16 while in London there were no deaths, compared with 3 in the previous week, of the 16 deaths recorded in the 126 Great Towns 2 each occurred in Manchester (3), South Shields (2), Norwich (0) There was 1 death from diphtheria —in Aberdeen (0)—in the 16 principal towns of Scotland during the week There was a drop in the notifications of scarlet fever in England and Wales and in London during the week—1,248, compared with 1,553, and 112, compared with 128 respectively, both these figures were well below the median values for the last nine years There were 2 deaths from scarlet fever in the 126 Great Towns during the week—1 each in London (1) and Acton (0)

Primary and Influenzal Pneumonia

There was a decrease in the notifications of primary and influenzal pneumonia in England and Wales during the week under review—423 as against 589—and in London—40 as against 43, both these figures were less than the median values for the last nine years

Summary for the Four Weeks ended July 30

In the four weeks ended July 30, 1938, 6,846 cases of scarlet fever, 4,105 cases of diphtheria, 2,016 cases of primary pneumonia, and 88 cases of enteric fever were notified in England and Wales The notifications of scarlet fever diphtheria, primary pneumonia, and enteric fever were 104 per cent 112 per cent, 105 per cent, and 41 per cent respectively of the expected numbers (deduced from the median values of the corresponding weeks of the years 1929-37)

Measles and Whooping-cough

The incidence of measles in England and Wales continues to decline During the week under review there were 3 deaths in the 126 Great Towns, compared with 5 in the previous week—1 each in Kingston upon Hull (0), Leeds (1), Plymouth (0) The average daily admissions to the L C C fever hospitals were 6, as against 8 in the previous week Notifications dropped in six of the metropolitan boroughs in which measles is notifiable, remained the same in three, and rose in two—Shoreditch 7 (2) and Stepney 4 (2) In Scotland the figures for measles rose from 62 to 66 in the week under review of the 66 cases, 24 (31) occurred in Kirkcaldy, 22 (20) in Dunfermline, 10 (1) in Edinburgh There was an appreciable decrease in the figures for Northern Ireland during the week —4 (all in Belfast) compared with 14 in the previous week In the 126 Great Towns of England and Wales there were 5 deaths from whooping cough during the week, compared with 7 in the previous week 1 each occurred in Gateshead (0) Liverpool (0) Manchester (0), Birmingham (1) and Wallasey (0) In Scotland 27 (25) cases of whooping cough were noted —21 (18) of which were in Glasgow—and 3 deaths (all in Glasgow)

Cholera

During the week ended August 6 1 265 cases of cholera and 254 deaths from this disease were reported in Shanghai and in Hong Kong 30 cases with 17 deaths Further increases in the incidence of cholera were noted in the Central Provinces —6 078 cases with 2 987 deaths—in Bombay (Presidency)—287 cases with 113 deaths—and in the North West Frontier Province—70 cases with 36 deaths

* Except where otherwise mentioned figures in parentheses refer to the week preceding the one under review

No. 51

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended August 6 1938

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year for (a) England and Wales (b) London (administrative county) (c) Scotland (d) Eire (e) Northern Ireland Median values for the last 9 years for (a) and (b)

Figures of Births and Deaths and of Deaths recorded under each infectious disease are for (a) The 126 great towns (124 in 1937) in England and Wales (including London) (b) London (administrative county) (c) The 16 principal towns in Scotland (d) The 13 principal towns in Eire (e) The 10 principal towns (9 in 1937) in Northern Ireland

A dash — denotes no cases a blank space denotes disease not notifiable or no return available

Disease	1938					1937 (Corresponding Week)					1929-37 (Median Value Corresponding Weeks)

QUERIES AND ANSWERS

Hypertrichosis

'E C would like suggestions for treatment of hair on chin in a lady of 30 She has had electrolysis twice at a beauty parlour with no benefit, A radiologist does not advise x rays Is there any centre in London or the provinces for treatment of such cases?

"Typhoid Mary"

Dr J D ROLLESTON writes Dr J Rosslyn Earp who kindly answered my query about this interesting person some weeks ago (see *Journal* June 4, p 1247), has been good enough to send me further information about her as follows 'I have just received the following memorandum from Dr Stebbins Since I informed you as to the recent history of Typhoid Mary, I find that I was in error in stating that she had died My informant was apparently in error and I failed to check up the truth of the statement I find that Typhoid Mary recovered somewhat following a cerebral haemorrhage approximately a year ago and is at present a bed patient at Riverside Hospital in New York City

Income Tax

Motor Car Expenses

'W S had two cars in 1937, both used in the practice One was sold in June 1937 for £20 the other was taken over at £80 in part exchange for a new car—list price £240—in October 1937 What amount can be deducted from the receipts for 1937-8?

* The original price of the car sold in October 1937, less £80 As the other car was not replaced no allowance is due We assume that annual depreciation was not claimed If so the result is unfortunate and this case illustrates a point we have called attention to on previous occasions—that is that the failure to claim depreciation often leads to pecuniary loss

Expenses as Part time M O H

CAR gave up practice owing to ill health and is working for the Ministry of Health on a sessional basis His duties take him to different towns and it is imperative that he uses his car for travelling to the various towns How does he stand as regards a car allowance?

Our correspondent is entitled to a deduction representing the actual cost of travelling—probably the best estimate will be on a mileage basis In the event of the local officials objecting that no allowance is due for the expense of travelling to the place where the work is performed CAR should point out that the work he does comes under one appointment not one for each particular piece of work, and that cost of travelling is always allowed in such circumstances

LETTERS, NOTES, ETC.

Thomas Annandale

Professor G GREY TURNER (Taplow Bucks) writes May I draw attention to a small error which has crept into your note at the end of Nova et Vetera on page 360 of the *Journal* of August 13 Thomas Annandale was appointed Regius Professor of Clinical Surgery in Edinburgh not in 1871 as you state, but in 1877 This was the year in which Sir William Fergusson died and Lister accepted the invitation to come to London to succeed him as Professor of Clinical Surgery in King's College Hospital Curiously enough this mistake as to the date has crept into the notice of Annandale in Plarr's *Lives of the Fellows of the Royal College of Surgeons* Incidentally may I say that Professor Annandale was the second son of Thomas Annandale who practised at Newcastle on Tyne and was surgeon to the infirmary in that town from 1854 to 1866 It was at Newcastle that the Edinburgh professor received his baptism in practical surgery

Sensitiveness to Bee Stings and Ant Bites

Dr C MCGUIRE (Dooars Bengal) writes In the case described by Dr F Alexander in the *Journal* of June 18 (p 1348) death may have been due to the patient being sensitized to the poison of the wasp and not to the amount of poison injected In 1934 I was called to see a tea planter's wife who had suddenly collapsed When I saw her she had regained consciousness and there was an extensive urticarial eruption all over the body, the pulse was very feeble and the rate 130 On being questioned as to her diet that day she mentioned that she was stung by a bee an hour previously As she had previously reared bees in Scotland and been frequently stung without any symptoms she never thought anything about it I gave her an injection of adrenaline and the symptoms quickly subsided I advised her to keep a syringe and some ampoules of adrenaline in the house in case she was stung again as she had now become sensitized to bee stings Between 1934 and 1937 she was again stung by a bee and on two occasions by ants and in each case the symptoms recurred and subsided after adrenaline administration In 1938 about a month ago, she was once again stung by a bee but this time nothing happened and no adrenaline was required In 1933, a year before the first bee sting she was treated for a severe attack of bacillary dysentery which may have caused her to become sensitized to bee stings and ant bites, now she has become desensitized

Fountain Pen Found

Mr MICHAEL COHEN (10, Fairway Prestwich Manchester) writes to say that his daughter wishes to restore to its owner a fountain pen found by her The pen is evidently a keepsake and has a gold band inscribed 'Dr J Johnston From L C H Patients, 1935"

Corrigenda

The first line of Surgeon Lieutenant Commander D F Walsh's paper on Treatment of Gonorrhoea with Uleron published in the *Journal* of July 30 (p 215), should read A case record and clinical observations on forty three cases etc and line 48 in column 1 of page 217 should read feel that at least two five day or even seven day

The General Superintendent of the Prince of Wales's Hospital Plymouth writes as follows with reference to an item published last week (p 379 col ii line 10) in the report of the meeting of Council of the Royal College of Surgeons of England at which certain hospitals were recognized under the Fellowship regulations The position is as follows This hospital consists of three amalgamated hospitals of which the former Royal Albert Hospital at Devonport is one It is to this hospital that the time limit of the recognition of the Royal College of Surgeons applies and *not* also to the Plymouth sections as your notice would indicate In *this* sense I consider the notice to be misleading had the words Plymouth and been omitted the reference would have been quite in order as it is a fact that the post referred to at Devonport is recognized only until December next although as a result of alterations that have recently been made there we hope that recognition will be permanently granted after a further inspection by the Royal College of Surgeons

KEY TO CURRENT MEDICAL LITERATURE

GENERAL JOURNALS

Deutsche Medizinische Wochenschrift

Berlin vol 64 June 10 1938

Contributional Factor in Tuberculous Processes *(to be continued)*—K Klare
Treatment of Extrapulmonary Tuberculosis in French Mediterranean—I Bérard and G Hermann
Value of Collapse Treatment of Pulmonary Tuberculosis—J Lommel
Treatment with Prontosil of Mixed Infections of Bone Tuberculosis and of Osteomyelitis—M Wendekamp
Serological Investigations in Tuberculosis with Special Reference to Meinicke's Reaction—A Hasskó and F Müller
Case of Tuberculosis Mitralis Lenta—K Buinewitsch
Paroxysmal Haemoglobinuria and its Treatment—P Berde and K H Jaeger
New Way to Oesophagoscopy and Bronchoscopy—R Korbsch
Orthopaedics in Service of Health Movement—H G van Schnack

Collapse Therapy—This statistical study from Jena shows that the collapse treatment of pulmonary tuberculosis considerably improves the prognosis. It is argued that an interval of at least two years is required before claims of successful treatment can be made. Years after this interval there is still apt to be a certain falling away from the originally good results.

Klinische Wochenschrift

Berlin vol 17 June 11 1938

Function and Significance of Mineral Substances *(concluded)*—H Glatzel
Survival of *Spirochaeta pallida* after Exposure to Lowest Temperatures (−271.5 C only 1.7 C above absolute zero)—F Jahnel
Is Present-day Enucleation of Tonsils Justifiable?—V Lautenschläger
Leukaemia with Undulating Leucocytosis—H Kammerer and M Wertheimer
Concerning Renin—G Hessel
Case of Cushing's Syndrome—K Reinhertz and B Schuler
Meningitis in Infancy caused by Meningococci and *Bact. enteritidis* Breslau
Pathogenic Properties of Breslau Bacillus—V Welcker and H Voss
Quantitative Estimation of Salvarsan in Cerebrospinal Fluid by Pulfrich Photometer—H Hullstrung and J Nordmeyer
Demonstration of Vitamin C in Tuberculous Foci—E Tonutti and J Wallisch

Cushing's Syndrome—In the case described the syndrome was caused by a tumour of one suprarenal. The pancreas, thyroid and hypophysis were normal. Some changes were found however in the ovaries.

Vitamin C in Tuberculous Foci—Vitamin C was found in appreciable quantities in the epithelioid cells of tuberculous foci. These cells are probably derived from the reticulo-endothelial cells. The vitamin was found in the cells surrounding the tubercle bacilli.

Lancet

London vol 234 June 11 1938

Pursuit of Shadows—W Langdon Brown
Treatment of Splenic Anaemia and Banti's Disease—L Howells
Cyclohexyl-ethyl triazol in Convulsion Treatment of Schizophrenia—W Mayer Gross and A Walk
Primary Tumours of Lacrimal Sac—G G Penman and E Wolff
Pregnancy and Oleothorax—J G Scaddin
Congenital Isolated Dextrocardia developing Auricular Flutter—H Davis
Globulin Test for Cerebro-spinal Fluid—K O Newman.

Splenic Anaemia and Banti's Disease—Ninety-four cases of splenic anaemia and Banti's disease have been followed up. Two-thirds—that is eighteen—of the untreated cases showed substantial spontaneous improvement. In the whole series splenectomy which was performed in fifty-one cases did not appear to improve the expectation of life or prevent the third stage complications as compared with medical treatment in forty-three cases. Iron after or without splenectomy was very effective in some but by no means all cases.

Medizinische Klinik

Berlin vol 34 June 10 1938

Diagnosis and Treatment of Affections of Nails—W Engelhardt

Production and Secretion of Thyroid Hormone—K Tsuji
Recognition of Wilful Simulation of Affections of Haematopoietic Erogenic and Respiratory Organs and of Metabolic Disturbances—P Reckzeh
Pronounced haemoglobinuria and Other Pathological Changes in Blood produced by Sulphanilamide—V Stiasser and K Singer
New Publications on Physiology and Pathology of Digestive Organs—L Norpoth

Thyroid Hormone—The follicular epithelium of the thyroid contains little iodine but the iodine forms part of an active thyroid substance while the colloid thyroid substance contains much iodine which is however in an inactive state. The follicular epithelium contains no thyroxine. The follicular epithelium has two functions: the production of the thyroid hormone and the production of the colloid substance. Iodine, insulin, suprarenal cortex and corpus luteum hormone stimulate the production of the colloid substance and thereby inhibit the thyroid function. Thyroid preparations and hormones of the anterior lobe of the pituitary (thyreotropic hormone) stimulate the production of thyroid hormones. The blood of patients suffering from hyperthyroidism contains a substance which is not unlike the thyroid hormone.

Medizinische Welt

Berlin vol 12 June 11 1938

Pathological-anatomical Principles in Diagnosis of Bone Tuberculosis—T Konschegg
Sun and High Altitude Therapy in Extrapulmonary Tuberculosis—A Rollier

Tuberculosis in the Aged—J E Kayser Petersen
Chronic Non-tuberculous Diseases of Lungs—F V Kovats
How do Weather and Climate influence Course and Cure of Tuberculosis?—W Amelung
Treatment of Haemorrhoids with Xylocain—H Hennen

Extrapulmonary Tuberculosis—Rollier publishes some statistics from his sanatorium at Leysin. Of his cases of extrapulmonary tuberculosis 80 per cent. were cured (of these 85 per cent. were quite fit for work) 16 per cent. were improved 3 per cent. remained stationary and 1 per cent. died. Treatment lasted from fourteen to twenty-five months. He draws attention to the fact that surgical tuberculosis is a general infection and must be treated as such. Sun and high altitudes have a beneficial effect on the lungs circulation, nervous system skin muscles and bones. Heliotherapy requires a special technique and careful dosage. In addition to sun and high altitude therapy Rollier uses orthopaedic methods and physical therapy in the treatment of these patients.

*Chemical and Therapeutic Investigations on Tetany —R Leriche and A Jung
Massive Coagulation of Pleural Fluid as Sign of Compression of Hilar Vessels by Neoplastic Process —R Poinso
Parkinson s Syndrome as Complication of Heine Medin s Disease —V Veil and V Ristic

Tetany —As a result of the investigation of eleven cases of tetany the authors come to certain conclusions (1) The blood calcium is not invariably low in tetany (2) The urinary calcium is usually low (3) The amount of calcium in the faeces is normal or slightly raised (4) The very marked lowering of the ratio of urinary to faecal calcium is chiefly due to the low calcium content of the urine (5) The total calcium does not appear to be lowered, and the skeletal calcium is not affected (6) Calcium gluconate had only a very slight effect on the urinary calcium (7) In some cases of tetany the convulsions are unaffected by the administration of calcium, parathormone, or A T 10 (8) Bone transplantation had very little effect on the blood or urinary calcium but it stopped the convulsions (9) Bilateral ablation of the middle cervical sympathetic ganglion would seem to be the most effective treatment, as it acts in cases in which calcium parathormone and A T 10 have failed

Paris vol 46 June 11 1938

Treatment of Prostatic Hypertrophy by Whole gland Testicular Extract — B Cuneo and J Jomain
*Agranulocytosis and Haemorrhoidal Strangulation —M Rachev and M Petrov

Agranulocytosis and Piles —A fatal case of progressive agranulocytosis is described in a man of 39 with strangulated necrotic piles The authors are inclined to think that the rectal condition was responsible for the agranulocytosis and not vice versa They stress the close relationship which appears to exist between the haematopoietic and the digestive systems

Substitute for Merfen — Uses of Mercury Acetate —B J Le Moller
Devegan Applicator —S A Lilania
Tuberculoid Structures in Tonsil —K Barnwater

Osteomalacia from Abuse of Laxatives—The case recorded by Professor Meulengracht is that of an engineer aged 71 who for thirty five years had taken Carlsbad salts daily The extreme decalcification of his bones was traced to inadequate absorption of calcium from the food in the digestive tract owing to the partial conversion of some of the calcium into insoluble calcium sulphate

Enhancement of Axillary Lymph Glands —A V v Frisch
Diagnosis and Therapy of Chronic Inflammations of Internal Female Organs —V Fuchs

Suprarenals and Angina Pectoris—With the exception of acute coronary occlusion angina pectoris is believed by Raab to be due to the release of quantities of adrenaline in persons whose coronary arteries are suffering from sclerotic changes This release is due to a variety of factors including psychic stimulation cold nicotine and muscular effort Raab argues that a partial suppression of adrenaline secretion by x ray irradiation of the suprarenals is therapeutically helpful In seventeen cases thus treated there were two failures and of the remaining fifteen cases the majority were cured

Role of Nutritional Deficiencies in Production of Cardiovascular Disturbances in Alcohol Addict —R Goodhart and N Jolliffe
Study of Myocardial Hypertrophy of Uncertain Aetiology associated with Congestive Heart Failure.—B I Kaplan E Clark and C E de la Chapelle
Abnormal Distribution of Superficial Muscle Bundles in Human Heart.—J S Robb and R C Robb
Effect of Digitalis on Form of Human Electrocardiogram with Special Reference to Changes occurring in Chest Lead —H J Stewart and R F Watson

Comparison of Percussion and Radiography—A comparison of the outline of the heart and superior mediastinal vessels as obtained by percussion under favourable conditions—that is using young male students—was made with the outlines obtained in teleradiographs (film tube distance of 2 metres) The mean differences in the two kinds of measurement were less than 1 cm in most intercostal spaces but in an individual case might be as much as 3 5 cm in the fourth left intercostal space The influence of stature and weight chest size and shape and of the position of the diaphragm was investigated A method by which an observer could estimate his own error of percussion is described

Frequency of Rheumatic Manifestations among Siblings Parents Uncles Aunts and Grandparents of Rheumatic and Control Patients — F E. M. Read A Ciocco and H B Taussig

Estimation of End points—In the titration of sera and viruses the end point is taken as the dilution at which a certain proportion of the test animals react or die Chance variations tend to make the end point indeterminate The method advocated is to take the 50 per cent reaction point instead of the usual 100 per cent By mathematical calculation or more simply by a graph on arith log paper the dividers may be used to mark off the exact end point which lies between the last two effective dilutions

Sex Differences in Tuberculosis Mortality—A statistical survey is made of the deaths from tuberculosis in four States over a period of sixty years and the change in mortality rates is noted together with crowding and occupation factors These do not account for the more rapid decline in female mortality and no satisfactory explanation is advanced

Rheumatism in Relatives—The family histories of thirty three rheumatic children and thirty three corresponding non rheumatic children were intensively investigated The occurrence of rheumatic manifestations—for example chorea acute rheumatic fever or rheumatic carditis—was invariably higher in the groups related to the rheumatic children—up to eight times as high among grandparents The findings are taken as supporting though not determining a familial or constitutional susceptibility to the disease the exposure factor not being eliminated

Experimental Infection in Mouse produced by Intratracheal Inoculation with *Haemophilus pertussis*—W L Bradford

Degenerative Arthritis—A detailed description is given of the gross and microscopical appearances, and of the apparent sequence of changes in an arthritis which causes lameness in equines and other animals The changes, which are purely degenerative and of unknown causation begin in the articular cartilage and are symptomless in the earlier stages, hypertrophic bony changes follow A comparison of fifty four such specimens from horses and mules with sixty specimens from human beings showed the lesions to be identical in the two species The condition in man is not seen in early life, but early stages of it are almost constantly found in the fifth decade and in a small proportion of cases they progress later to a stage causing disability

Fatty Infiltration and Hepatic Cirrhosis—It is argued in this paper that the primary change in alcoholic cirrhosis is a fatty infiltration, due in part to the action of alcohol in preventing tissue oxidation, and in part to inadequate food intake Cases are described which died at this stage, following extreme and sometimes comparatively brief alcoholic excess Long continued fatty infiltration is considered to cause cirrhosis mechanically by direct pressure on the peripheral cells of the lobule, and by interference with vascular supply leading similarly to atrophy and hence fibrous replacement Intermediate stages are observed between the enlarged liver of fatty infiltration and the shrunken liver of advanced alcoholic cirrhosis, in the author's experience this gradation is so complete that he regards the mechanism of production of alcoholic cirrhosis as demonstrated That fatty infiltration is the primary change is also suggested by two cases in which this condition was due to diabetes and went on to cirrhosis in the absence of alcoholic excess

Protracted Roentgen Therapy of Pharyngeal Lymphosarcoma—A Jutras
Study of Back scatter—E H Quimby L D Marinelli and J H Farrow
Methods of Applying Radium Element in Form of Needles and Tubes—G C Wilkins

Thoracic Aortic Aneurysms—A saccular aortic aneurysm may develop in the course of a few weeks, and by its rapid increase may suggest the presence of a malignant mediastinal neoplasm A period of survival of almost ten years is not incompatible with a large aortic aneurysm with extensive vertebral erosion Although a thoracic aneurysm may destroy adjacent vertebrae, it may furnish in their place partial support for the vertebral column

Irradiation of Cervical Glands in Mouth and Lip Carcinomata—This paper is based on an analysis of 252 cases of carcinoma of the lateral border of the tongue treated at the Memorial Hospital, New York and of 1,363 cases of intraoral cancer It gives the relative indications for dissection or irradiation of the cervical glands Surgery offers a better chance in the operable group, whereas patients with advanced disease will live longer and more comfortably, and have a greater chance of cure, when the glands are treated by irradiation

Annales de l'Institut Pasteur

Paris vol 60 May 1938

*Influence of Skin on Susceptibility and Resistance to Fowl Sarcoma—A Besredka and L Gross

Experimental Tumours in Plants caused by Various Chemical Agents Suggested Explanation—J Gheorghiu
Unsuspected Action by Fertilizer Industry in Diminishing Fertility of Soil—G Bertrand

Skin and Fowl Sarcoma—Whereas subcutaneous injection of a suspension made from a fowl sarcoma is followed by the slow development of a progressive tumour, the intradermal

injection of the same material causes the rapid appearance of a tumour which then remains stationary and sometimes regresses An immunity develops with regression which is not passively transferable

Tumours and Viruses—The virus of lymphogranuloma inguinale (poradenitis venerea) administered intracerebrally to a mouse which has also been given a transplantable sarcoma subcutaneously appears in the tumour and is transferable with it in series without loss of virulence in the virus and without any apparent effect on the tumour (This capacity of malignant tumours for carrying and serving as a kind of culture medium for quite unrelated viruses has been reported before but not in the case of this virus)

Review Role of Vitamin B in Resistance *(concluded)* —D Perla

Experimental Atherosclerosis —Bruger and Fitz administered the thyrotropic hormone of the anterior pituitary for periods of over 100 days to rabbits fed with excessive amounts of cholesterol in the expectation that it would diminish cholesterol deposition in the arteries It had the opposite effect which is possibly to be explained by the development of an anti-thyrotropic substance and a consequent fall in the rate of metabolism during the latter part of the experimental period (metabolic rate estimations were not made) There are analogies between details in these experimental findings and the data acquired in man which suggest that cholesterol deposition in both species may depend on hypercholesterol-aemia combined with other factors

Influence of Temperature upon Proliferation of Infectious Fibromas and Infectious Myxomas Viruses in Rabbits—R L Thompson
Effect of Washing and Physical Agents on *H pertussis*—J V Lumsden and W S Takaki
Studies on Bacteriology and Immunology of Chronic Staphylococcal Osteomyelitis I Cultures Involved Anti-haemolysin in Patients Serum Local Inflammatory Reaction—E E Hare S W Blank and C M Davis
Decomposition of Ascorbic Acid by Certain Bacteria Studies in Bacterial Metabolism CIX—V J Kordatzki and H Chinn
In vitro Action of Immune Rat Serum on Nematode *Nippostrongylus muris*—M P Sarles.

The Bacterial Decomposition of Ascorbic Acid—By repeated subculture in a broth containing ascorbic acid many strains of bacteria mainly of coliform type were isolated from faeces or gastric contents which decomposed ascorbic acid Some strains were also found which under the same conditions retarded its decomposition The rate of disappearance of ascorbic acid in cultures of these various bacteria was studied under different conditions It is considered possible that bacterial action in the bowel may be a factor in vitamin C deficiency

Radiology

St Paul Minnesota vol 30 June 1938

Calcification and Ossification of Kidney Review of Literature and Report of Cases Part II—A E Goldstein and B S Abelhouse
Roentgen Treatment of Chronic Sinusitis—F E Butler and I M Woolley
Pain Its Surgical Relief and Role of X Ray Localization Therein—M B Greene and J Kaufman
Biological Influence of Gamma Rays on Glandular and Hair System of Skin in Normal and Pathological Conditions—V Talumbo
Dosage Duration of Treatment and Reactions in Protracted Fractional Roentgen Treatment with Special Reference to Carcinoma of Upper Air Passages—J Juul
Apophyseal Intervertebral Articulations Roentgenologically Considered—A Oppenheimer
Primary Bronchus Carcinoma Diagnostic and Therapeutic Consideration—W L Matthew
Effect of Fractional Roentgen Technique on Incidence of Vaginal Fistulae in Carcinoma of Cervix—F R Smith
Direct Radio-cinematography—V de Maele
Radiotherapy of Bladder Carcinoma Five year Results Failures Future Therapy—B S Barringer
Reflecting Photo-electric Erythema Evaluator Preliminary Report—O R Troje
Ancient Arthritis—E Burnham Chamberlain and R B Taft
Case of Severe Injury to Chest Wall and Diaphragm—E W Rowe
Object Reconstruction by Planigraphy Reconstruction and Localization of Planes—J Kaufman

X Ray Treatment of Chronic Sinusitis—Good results are reported in infection of the nasal accessory sinuses One treatment is usually sufficient The dose varies according to the penetration of the radiation used It is about 600 *r* for medium hard radiation and about 450 *r* for hard radiation

Vaginal Fistula—The incidence of this complication of carcinoma of the cervix is more than twice as high in untreated as in irradiated patients Fistulae are therefore more often prevented than caused by radiation therapy

Revue d'Orthopedie et de Chirurgie de l'Appareil Moteur

Paris vol 25 March 1938

Rivista di Patologia Nervosa e Mentale

Sicily vol 51 March April 1938

Progressive Paralyses and Endemic Malaria—V Desogus
Experimental Lesion of Brain and Spinal Cord Induced by Cyanide of Potassium—I Jedlowski
Further Data in Knowledge of Anatomical Basis of Reversible Functional Changes in Optic Nerve in Quinine Intoxication—P Jedlowski
Histological Anatomy of Syndrome of Guillain Barre's Acute Curable Polyradiculitis with Dissociation of Albumin and Cell Count in Cerebro spinal Fluid—O Balduzzi
Acute Febrile Hyperkinesis—V Longo
Simmonphare Test in Symptomatology of Nervous Disease—O Balduzzi

Progressive Paralyses and Endemic Malaria—The important question as to whether an attack of endemic malaria protects the individual from general paralysis has been examined especially in the malaria infested island of Sardinia The author concludes definitely that endemic malaria is not associated with a diminution of incidence of general paralysis Endemic malaria is generally associated with a low grade of civilization and in such regions syphilis may spread more readily and be treated less efficiently But however such considerations and the question of the dermotropism of the spirochaete in lower grades of culture and its neurotropism in higher grades complicate the statistical records the conclusion that the fact of having had malaria does not protect the individual from general paralysis of the insane is not affected

Experimental Lesions Induced by Potassium Cyanide—Parenteral administration of potassium cyanide will produce disseminated demyelinating lesions of the white matter throughout the nervous system Donaggio's technique shows the stages through which the degenerated areas pass These resemble the lesions seen in Schilder's disease and the author suggests that this represents one of the rare occasions on which experimental lesions in animals are identical with the changes observed in acquired human disease

Reversible Functional Changes in Optic Nerve in Quinine Intoxication—The amblyopia and blindness which may occur when quinine hydrochloride is administered is due to primary degeneration of the nerve fibres which may be demonstrated by Donaggio's technique and is not due to secondary effects induced by vascular changes This initial stage of primary degeneration is reversible

Strahlentherapie

Berlin vol 62 May 18 1938 Heft 1

Vegetative Nervous System and *X* Rays—R Glauner
A New X Ray Effect—K Staunig and J Lobering
Protracted *X* Ray Dosis—K Nitze and H Iven
Irradiation of Curved Surfaces—A Proppe
Radium Moulds made of Wax and of Dental Impression Compound—W Luther
The Fiction of the Effective Dose (*Wirkungsdose*)—L Fiedler
The Fiction of the Effective Dose (*Wirkungsdose*) Remarks on the Paper by Fiedler—H Holthusen
Standards of German Roentgen Society (DRG) Rules for Measuring X Ray Dose in Medical Practice
Teaching of Radiology in Germany—H Mayer
Principles of Radiotherapy of Inflammatory Conditions—W v Wieser
Effect of *X* Rays on Cellular Metabolism—D Laszlo and W Fleischmann
Mode of Action of *X* Rays on Inflammatory Processes—F Freund
Conservative Treatment of Gynaecological Inflammatory Conditions by Means of *X* Ray—H Wintz
Effect of Weak *X* Ray Doses in Gynaecological Affections—E Gaizago
X Ray Therapy of Whitlow—O Spitzenberger
X Ray Therapy of Tonsilitis—G Schwarz
Different Phases of Effect of *X* Ray Treatment of Tonsils and their Significance for Radiation Therapy of Different Affections of Tonsils—F Windholz
X Ray Therapy of Acute Inflammatory Perionsillar Infiltration—A Frank
X Ray Therapy of Calcaneal Spur—L Pokorny
X Ray Therapy of Absolute Glaucoma—G Wachner
X Ray Therapy of Neuritis—H Hammer

X Ray Treatment of Whitlow—The author advises small doses not more than a total of 400 to 500 *r* in daily doses of 50 *r* In more chronic cases doses of 100 *r* may be given every second day up to a total of 500 to 800 *r* Whitlows of

trophic origin as in syringomyelia, for example do not respond to this treatment

X Ray Treatment of Calcanean Spur—This has proved successful in a number of cases The following technique was used field 6 by 8 cm four applications at intervals of five days 110 r at each sitting 160 kV filter 0 5 mm of copper and 1 0 mm of aluminium The series was repeated after eight weeks A third series may be given at a later date

Virchows Archiv fur Pathologische Anatomie und Physiologie und fur Klinische Medizin

Berlin vol 302 June 17 1938

Importance of Pathological Anatomy of Domestic Animals in Comparative Pathological Anatomy—J Dobberstein

Lymphogranulomatosis—K Stojalowski
Endophlebitic Spleen Tumours Comparison of Endophlebitic Tumours of Spleen in Cases of Kala azar and Banti's Disease—G Oberson
Development and Fate of Umbilical Artery Study of Vascular Pathology—G Schallock
*Relation of Thrombosis Emboli and Apoplexy to Weather—P H Kayser
Intraneural Growth of Optic Nerve Glioma—W Eickhoff
Study of Normal Thyroid Glands from Patients in Coastal Regions of Turkey and especially from Region of Istanbul—O Saka
Effects of Carbon Monoxide and Coal Gas on Growth of Tissue Cultures—E Rix and L Ehrhardt
Renal Damage in Oxalic Acid Poisoning—H Tobben's

Thrombosis Embolism Apoplexy and the Weather—Post-mortem examination of 253 persons showed that the formation of thromboses and the onset of apoplexy are more frequent in warm weather than in cold weather or when a damp south wind prevails, but are infrequent during a period of settled weather No seasonal fluctuations were observed in the occurrence of vascular diseases Thromboses seldom occur in countries with continental climates Patients sensitive to weather react pathologically to every change in weather Fat people tend to thromboses more than thin ones It is suggested that the active factor in weather is possibly atmospheric electricity which may affect the vegetative nervous system by way of the skin and thus lead to retardation of blood flow and to thrombosis

Wiener Archiv fur Innere Medizin

Vienna vol 32 May 31 1938

Studies of Objective Factors in Hunger and Satisfaction of Appetite—J Monaunt
*Nerve and Hormone Regulation of Basal Metabolic Rate—W Winkler
Effect of Weak X Ray Irradiation on Production and Composition of Lymph of Dogs—J Granatowicz
Pathogenesis of Acute Thrombopenic Purpura Purpura after Sedormid—A Vogel

Regulation of Basal Metabolic Rate—The figure expressing the basal metabolic rate is the sum of the metabolic processes of the tissues during rest, especially of liver and muscle Three endocrine glands—the pituitary thyroid and adrenal—have an influence partly directly and partly through the peripheral and central nervous system There is a centre for the regulation of all these functions in the middle brain

Thrombopenic Purpura—Purpura occurring after the administration of sedormid is not due to a toxic condition but is purely allergic Chronic cases are caused by recurrent allergic reactions while the drug is being administered The platelets completely disappear within a few hours and reappear two to three days after the medication has been stopped Apart from one case of purpura cerebri the patients recovered completely

Zeitschrift fur Immunitatsforschung und Experimentelle Therapie

Jena vol 93 May 1938

Comparative Studies of Immunizing Capacities of Diphtheria and Tetanus Formol Toxoid—M v Eisler and F Gottdenker
Effect of Minimal Doses of Other Bacteria on Fever Produced by H paratyphosus—S Nukada and T Yoshu
Effect of Minimal Doses of Bacteria on Fever Produced by Gonococci—S Nukada and T Yoshu

Zeitschrift fur Infektionskrankheiten, Parasitare Krankheiten und Hygiene der Haustiere

Berlin vol 53 July 2 1938

Contributions on So-called Borna's Disease (Brain ill) and Infectious Anaemia of Horses—K Holz
Bartonella Infection among Cattle—O Nieschulz
Pathological Anatomy and Histology of Swine Paratyphus—Hermann Meissner
Are Rats Concerned in Distribution of Contagious Abortion?—A Sanfelice
*Diagnosis of Abortus Bang Infection (Brucellosis) of Cattle by Serological Methods—M Seelemann and A Pfeiffer
Yolk Agglutination in Chick Dysentery—E R Stollowa

Serology of Brucellosis—The authors describe in detail two procedures for the determination of brucellosis infection by flocculation—the Sachweh reaction and the Meinicke reaction—as applied to blood serum, whole milk, and milk serum The relative merits of the reactions, the consistency of the results given, and the applicability of the methods in practice are discussed Seventeen photogravure reproductions illustrate the text

Zeitschrift fur Kinderheilkunde

Berlin vol 60 June 20 1938

Schaumann's Benign Granulomatosis—O Naumann
Course of Infantile Cramp Diseases and Effect of X Rays upon Them—E Wittermann
Rickets and Development of Hand in First Years of Life—E Graser
*Influence of Vitamin E on Maternal Lactation and Infantile Growth—G Gaedke and C Bennholdt Thomsen
Phosphorus Esters in Human Cow and Goat Milk—G DeToni and G Gorini

Vitamin E—Gaedke and Bennholdt-Thomsen came to the conclusion after a long series of experiments that vitamin E has no effect whatever on the quantity of milk in the breast nor on the growth of the infant Vitamin E has been stated to have a galactogogue action, but this the authors disproved in humans and rabbits The milk of women to whose diet vitamin E had been added contained no more fat than normal human milk

Zeitschrift fur Urologie

Leipzig vol 32 June 1938

*Question of Haematogenous Origin of Bladder Purpura and Non-specific Bladder Ulcer—E Meyer
Vitamin C in Urinary Diseases—C E Alken
Question of Primary Closure of Bladder in Suprapubic Prostatectomy (Harris Operation)—Th Hryntschak
Indications and Technique of Artificial Withdrawal of Urine—E Pflaumer
Criticism of Artificial Urinary Bladder—F de Gironcoli
Scheele's Plastic Operation on Bladder with a Ring of Small Intestine—H Friedrich
Addendum to Intestinal Siphonage Bladder—L Seiffert

Bladder Purpura—Twenty three cases of bladder purpura and fifty two cases of non specific bladder ulcer are analysed In the great majority of cases some primary septic focus could be demonstrated The author inclines to the view that these bladder lesions are causally related to the presence of oral and other septic foci and stresses the importance of dealing with these primary lesions

Take THE BURBERRY *With You*

Then, if the bright morning does turn out to be a drenching afternoon or the warm breeze change to a biting Nor'-east wind, you're certain of being dry and comfortable

Under its protective cover there is comforting warmth on cold days complete security from penetrating rain airylight freedom on the closest day

The Burberry therefore has the virtues of three coats in one —

DUST COAT for hot days
WEATHERPROOF for wet
OVERCOAT when it's cold

Patterns prices and illustrated models on mention of the British Medical Journal'

A Solution to a HEALTH PROBLEM

Sunshine and blue skies farms and homesteads nestling among mountains and hills blossoms of peach and plum filling the valleys with colour the perfume of orange groves the profusion of wild flowers the camp fire and the thrill of wild game in the Low Veld the picturesque kraals and laughter-loving natives the quest of open roads trailing to far horizons the sparkling air of the High Veld sea and sun bathing on golden beaches the bright warm days and cool starlit nights—these memories and the joyous feeling of health and fitness after my last holiday in South Africa will lure me back there before long

These are a recent visitor's impressions of a South African holiday

Those concerned with problems of health might well consider the benefits to be derived from exchanging the rigours of a European Winter for Sunshine and blue skies It is now only a fortnight's voyage to

SOUTH AFRICA

LONDON HOSPITAL MEDICAL COLLEGE AND DENTAL SCHOOL

THE WINTER SESSION will open on MONDAY, OCTOBER 3rd

The London Hospital serves the East End of London and with eight hundred and ninety beds is the largest voluntary Hospital in England The Out patient Department which deals with a hundred thousand new patients per annum is extensively used for teaching

The size of the Hospital necessitates a large number of resident medical officers Every year seventy resident house physicians and house surgeons and eighty salaried non resident clinical assistants are appointed from among recently qualified students The opportunities which these appointments offer for obtaining clinical experience are invaluable

The Medical College is attached to the Hospital and is staffed by Professors of Anatomy Physiology Bacteriology Chemical Pathology Morbid Anatomy and Medicine of the University of London

Special Courses in Anatomy and Physiology for the Primary F R C S and advanced courses in Surgery for the Final F R C S Examination and in Medicine for the M D and M R C P Examinations are held twice a year

Entrance Scholarships and prizes of the total value of £950 are awarded annually Research Funds to the value of £113 000 permit of assistance being given to students and graduates engaged in medical research

The Medical College contains a modern Museum of Pathology and a Library provided with all the current medical periodicals in charge of a full time librarian There is also an Athenaeum Club and Dining Hall a Gymnasium a Fives Court and two Squash Courts in the Students Hostel The Athletic Ground of 13 acres at Hale End is within easy distance of the Hospital

The Hospital is only 20 minutes from Charing Cross and Baker Street Stations For those who wish to live in immediate proximity to the Hospital there is accommodation for seventy five students in the Students Hostel

Further details may be obtained from the Dean Dr A E Clark Kennedy M D F R C P Physician to the Hospital and Fellow of Corpus Christi College Cambridge who is always pleased to meet students wishing to see the Hospital and College and to whom application for admission should be made

HENRY KIMPTON'S PUBLICATIONS

NEW BOOK — JUST OUT

CAUSE AND PREVENTION OF DISEASE

By WILLIAM HARVEY PERKINS, M.D.

Royal Octavo, 712 pages — Cloth

Price 35s. net (Postage 1d.)

The work is important in that it brings together in one volume a large amount of information which is scattered throughout many publications, and which is required for a proper understanding of the causation, prevention and treatment of disease.

NEW BOOK — JUST READY

CANCER

With Special Reference to Cancer of the Breast

By R. J. BEHAN, M.D.

Large Octavo, 344 pages with 163 Engravings — Cloth

Price 12s. net

NEW WORK — JUST READY

PEDIATRIC SURGERY

By EDWARD C. BRENNER, M.D., F.A.C.S.

Royal Octavo, 834 pages, with 293 Illustrations — Cloth

Price 45s. net

Many of the articles included in this volume are regarded by eminent authorities as standard treatises on the subjects with which they deal. The practical character of the work is maintained by the exclusion of matter of a purely theoretical nature. The value of the book is enhanced by the incorporation of a large number of illustrations, many of which have been specially prepared for the work. The publishers believe that this volume will be found a most valuable addition to the literature of modern surgery.

NEW EDITION — NOW READY

METHODS OF TREATMENT

By LOGAN CLENDENING, M.D.

Sixth Edition, Revised. Royal Octavo, 879 pages, with 193 Illustrations — Cloth

Price 12s. net

The book is a mine of information on all the methods of treatment in general medicine and at the same time provides for which material is usually widely separated in medical literature.

The most attractive book of its kind we have seen. — The Journal of the American Medical Association.

NEW (THIRD) EDITION — JUST READY

DISEASES OF THE THYROID, PARATHYROIDS AND THYMUS

By ANDRÉ CROTTI, M.D., F.A.C.S., LL.D., R.I.C.S.

THIRD EDITION THOROUGHLY REVISED AND ENLARGED

Imp. Octavo, 1229 pages with 262 Illustrations and 39 Plates in Colour — Cloth

Price £4 10s. 0d. net.

NEW WORK — JUST OUT

PRACTICAL OTOLOGY, RHINOLOGY AND LARYNGOLOGY

By ADAM EDWARD SCHLANSER, M.D.

Royal Octavo, 315 pages with 31 Engravings — Cloth

Price 21s. net (Postage 6d.)

It is the purpose of this book to show how each of the complaints that occur in otorhinolaryngological practice may be handled exactly, directly and successfully. To this end the book has been made distinctly clinical and its instructions may be followed with certainty, confidence and ease.

NEW BOOK — JUST OUT

SYNOPSIS OF THE DIAGNOSIS OF THE ACUTE SURGICAL DISEASES OF THE ABDOMEN

By JOHN A. HARDY, M.D., F.A.C.S.

Demy Octavo, 345 pages with 92 Illustrations — Cloth.

Price 20s. net (Postage 6d.)

In this book the effort has been made to provide a concise, accurate and complete synopsis of, and a review of the methods of diagnosis of the acute surgical diseases of the abdomen, and to avoid future needless and disastrous

NEW BOOK — JUST READY

THE HEART IN PREGNANCY

By JULIUS JENSEN, Ph.D., M.R.C.S.(Eng.), L.R.C.P.(Lond.)

Large Octavo, 371 pages with 9 Illustrations — Cloth

Price 25s. net (Postage 8d.)

SECOND EDITION — JUST READY

THE MANAGEMENT OF FRACTURES, DISLOCATIONS, AND SPRAINS

By JOHN ALBERT KEY, B.S., M.D. and H. EARLE CONWELL, M.D., F.A.C.S.

Second Edition, Revised and Enlarged. Large Octavo, 1246 pages with 1222 Illustrations — Cloth

Price 52s. 6d. net

This book is complete in every detail as regards the treatment of fracture, sprain and dislocation, covering the anatomy, diagnosis, symptomatology as well as description of the operative procedure of fracture and of the newer methods of skeletal traction.

OVALTINE

FOR THE OLD AND FEEBLE

DURING old age when the digestive powers and vitality are on the wane the problem of satisfactory feeding often becomes acute A solution to this difficulty is found in Ovaltine Its delightful flavour appeals to the jaded palate its digestive action aids the enfeebled assimilation while its high nutritive value stimulates the flagging metabolism It is a boon to the aged

In Ovaltine the nutritive constituents of fresh milk eggs and malt are transformed into crisp granules which dissolve readily in milk to form a delicious beverage A cup of Ovaltine in the morning ensures energy for the day and a cup on retiring generally relieves the sleeplessness so common a symptom of old age and gives digestive rest

Ovaltine enriches the diet in certain important factors notably calcium and vitamins A and B_2 which recent investigations have shown to promote longevity

ENDOCRINE TREATMENT OF

DYSMENORRHŒA

with B.D.H. Sex Hormone Preparations

Cases of dysmenorrhœa which are essentially endocrine in nature are of two distinct types, one being associated with disorders of uterine structure and the other with disorders of uterine function

(1) Dysmenorrhœa associated with myohypoplasia

It is stated that the commonest finding in a case of dysmenorrhœa is persistence of an infantile type of uterus with small body and relatively long slender cervix

The power of the œstrogenic hormone to stimulate development of the uterine musculature is such that Oestroform is specific therapy in this condition

DOSAGE. Injections of Oestroform 20 000 international benzoate units or in very marked cases 50 000 international benzoate units, are administered twice weekly for the first two weeks of the intermenstruum

Such a course of treatment should be repeated regularly until the uterus appears normal on examination and the patient is able to menstruate with considerably less or no pain In the majority of cases success is obtained after three courses

(2) Dysmenorrhœa due to abnormal uterine motility

In endocrine cases in which the uterus is found to be normal on examination, the pain is usually regarded as being due to functional abnormality in the myometrium leading to spasmodic contractions of the uterus

The power of the luteal hormone to reduce the activity and contractility of the uterine musculature has indicated its use in this condition.

DOSAGE. Progestin B D H 2 international units should be administered on alternate days for the week immediately preceding the calculated onset of the menstrual flow

This course should be repeated several times in order to establish a more normal functioning of the myometrium

Ventron Capsules

Each capsule contains

Ventriculin (Concentrated) 5 grs.
(equiv. to 15 grs. of Ventriculin)

Naferon (Iron and Sodium Citrate Neutral) 2 grs.

Vitamin B_1
20 International units

Vitamin B
5 Sherman units

'VENTRON' is a combination suitable for the treatment of many forms of primary and secondary anæmia and for use as a general hæmatinic and tonic in any form of debility, especially in patients recovering from operations or severe infections. It contains desiccated gastric tissue (Ventriculin) in concentrated form, together with the vitamin B complex and iron and sodium citrate, a neutral soluble iron compound that is practically non-irritating to the gastro-intestinal tract and has a decided advantage over most other iron preparations. 'Ventron' is issued in hermetically-sealed capsules, which eliminate the odour, taste and bulk associated with other methods of exhibiting desiccated gastric tissue.

Supplied in bottles of 50 capsules

ONE·HALF { *the dosage* / *the quantity of drug to be eliminated*

Administered orally, rectally or in emergencies intravenously Nembutal exerts an extremely rapid but brief hypnotic and a pronounced sedative action from a dosage only about one-half that required with most other powerful barbiturates This small dosage reduces the recovery period also by about one half and, by lessening the amount of the drug to be eliminated, makes Nembutal clinically one of the safest of the barbiturates ● Safety rapidity and brevity of action recommend Nembutal for use not only as a pre anæsthetic sedative in major and minor surgery but also in the treatment of insomnia hysteria sea sickness nausea from any cause eclampsia delirium tremens convulsions from strychnine or other poisoning and in obstetrics—with or without morphine and scopolamine Nembutal has also been used with much success as a supplement to morphine in controlling the pain of early cancer ● Nembutal is available through pharmacies in a wide variety of forms, the most widely employed of which are the ½-grain and 1½-grain capsule for oral use Literature and a trial sample of Nembutal 1½-grain Capsules will be sent upon request. The coupon is for your convenience

INDICATIONS FOR 'SANATOGEN' No 10

GASTRO-INTESTINAL DISORDERS

Appendicitis and Duodenal Ulcer.

"Essentially 'civilized' diseases", say Colonial Doctors

In recent numbers of the "British Medical Journal" doctors practising in Uganda, in the Falkland Islands and in British Guiana have emphasised the growing conviction that both duodenal ulcer and appendicitis are essentially diseases consequent on civilised dietaries Both in British Guiana and in Uganda very little meat is eaten by the natives A surgeon in the Uganda medical service reports that in the last ten years he has found only three cases of appendicitis in Uganda "One was chronic, and the diet was probably vegetarian One was a perforation, with general peritonitis, the diet was more mixed The third was a localised abscess, the dietary included meat" In the Falkland Islands where the inhabitants live mainly on meat, out of every hundred operations performed in 1925, 80 were performed for appendicitis, whereas in the British Guiana native population, only one operation out of one thousand in 1926 was on account of appendicitis

The moral would seem to be that we should rely mainly on our carbohydrates for our food bulk and energy fuel, and that we should use meat and fish almost entirely for their protein content and for the two vitamins which animal fat contains in concentrated form

A vegetarian diet supplemented by butter and 'SANATOGEN' would seem to be ideal when there is any suspicion of the beginning of duodenal ulceration or of appendicular inflammation

'SANATOGEN' is a carbohydrate-free product of ninety-five per cent pure milk casein with five per cent sodium glycerophosphate

GASTRITIS

"I had tried a varied dieting in a case of Gastritis, with rather disappointing results, and resolved to persuade my patient to adhere to a course of Sanatogen This was carried out strictly with very good results Pain, sickness, etc disappeared and now a modified diet can be taken with no discomfort —M B, Ch B

'I have to say that I still find your preparation, Sanatogen of great value in cases of nervous debility and as a tonic in cases of patients recovering from Gastric or Duodenal ulcers —M B, B Sc

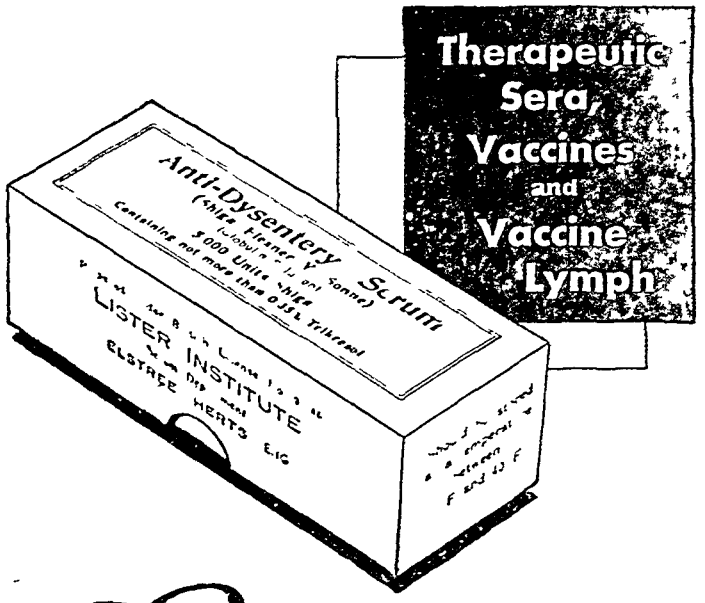
'Sanatogen was used in a case of severe Gastritis (pre ulceration condition), and it seemed to me to be both of use as a bland non-irritating food and also of benefit as a tonic It was therefore, a useful addition to the rather severe diet The case is making very satisfactory progress —M B, B S

'SANATOGEN'

(Trade Mark)

A brand of Casein and Sodium Glycerophosphate

Sold by all chemists price 2/3 to 19/9



DOSAGE For children and adults two teaspoonsful three times daily or according to circumstances For infants ½ teaspoonful added to each bottle feed

The word SANATOGEN is the Trade Mark of Genatosan Ltd and denotes their first Brand of Casein and Sodium Glycerophosphate

All GENATOSAN products are made by GENATOSAN Ltd Loughborough Leicestershire

Clinical samples and literature available on request to

GENATOSAN LTD., LOUGHBOROUGH, LEICESTERSHIRE

The Lister Institute
OF PREVENTIVE MEDICINE

Therapeutic Substances Act, Licence No 9

Anti-Dysentery Serum

Anti-Dysentery Serum is prepared from the serum of horses that have been highly immunized against *Bacillus dysenteriæ* While much of the endemic dysentery of tropical and sub tropical lands is caused by pathogenic amœbæ, epidemic dysentery due to *Bacillus dysenteriæ* occurs all over the world, and bacilli of the dysentery group are found also in asylum or institutional dysentery in some sporadic cases of ulcerative colitis, and in certain forms of summer diarrhœa

The content of Shiga antitoxin in Anti-Dysentery Serum can be determined and, in accordance with the requirements of the Therapeutic Substances Regulations, is stated in terms of an International unit

Anti Dysentery Serum (Multivalent) Shiga (5 000 units)
Flexner, Sonne, and Y (Concentrated)
In ampoules of about 10 c cm , at 8/6 per ampoule.

Anti Dysentery Serum Shiga (10 000 units per ampoule)
at 8/6 per ampoule

TOXIC AND INFECTIVE JAUNDICE*

BY

C E LAKIN, M D, F R C P

Physician to the Middlesex Hospital and the London Fever Hospital

In opening this discussion on toxic and infective jaundice I am proceeding on the assumption now pretty generally accepted that the parenchymatous cells of the liver have *nothing to do with the formation of bile pigment* that the pigment is derived from haemoglobin liberated from more or less effete red corpuscles and that the transformation of haemoglobin into what I may call pre hepatic bilirubin is attributable to the activity of cells of the so called reticulo-endothelial system In this conception the liver is regarded as playing the part of an excretory organ for bile pigment though in passing through the liver cells some subtle alteration in the physico chemical nature of the bile pigment takes place since what may be termed post hepatic bilirubin has slightly different characters from its pre hepatic precursor

The Three Types of Jaundice

Staining of the skin and tissues by bile pigment—for this is what is meant when we employ the word jaundice in clinical medicine—may arise in three different ways The first is when some gross obstruction to the escape of bile into the intestine leads to the damming up of bile in the excretory ducts with subsequent absorption of bile into the blood stream—the so called obstructive jaundice Here not only is there absorption of post hepatic bilirubin but of bile salts and cholesterol Some observers have thrown doubt on the reabsorption of these substances pointing out that when a pressure of from 200 to 300 mm of water is attained in the bile ducts the excretion of bile pigment ceases and that this is sufficient to explain the occurrence of staining of the tissues in obstructive jaundice The second way is when excessive blood destruction leads to the accumulation in the blood stream of such a large amount of pre hepatic bilirubin that the excretory function of even a healthy liver is overpowered—the so called haemolytic jaundice And the third way is when the liver itself is damaged so that it becomes unable to work at its normal level—the so called toxic or hepatogenous jaundice It is with this last type of jaundice alone that we are concerned

Among the poisons which act by damaging the liver cell are phosphorus arsenic antimony chloroform carbon tetrachloride, trichlorethane toluylenediamine aniline benzene cinchophen derivatives and certain mushroom poisons Microbic activity may be responsible as in the jaundice of pyaemia septicaemia pneumonia and typhoid or protozoal infections as in spirochaetal jaundice malaria and syphilis In other instances a virus may be the *offending agent* as in yellow fever with or without a secondary microbic infection while yet again some autogenous toxin may be responsible as in toxaemia of pregnancy some cases of acute yellow atrophy and perhaps Hanot's cirrhosis Anoxaemia probably plays an important part in the jaundice of congestive cardiac failure

Pathology of Toxic Jaundice

Whereas in obstructive jaundice the sufferer is likely to be more jaundiced than ill in toxic jaundice he is likely to be more ill than jaundiced though deep jaundice is sometimes seen Except in the most severe cases the stools remain fairly normal in colour Fever is usually an accompaniment of toxic jaundice though in some of the most serious forms such as acute yellow atrophy, the temperature may be subnormal Varying quantities of bile may be found in the urine in addition to urobilin and albumin bile stained casts and sometimes red blood corpuscles are likely to be present while the excretion of amino acids may be raised *In severe cases the blood sugar falls* and in a case known to me in which severe liver damage ended in convulsions the blood sugar fell to nearly 70 mg per 100 c cm while daily examination showed a steady fall of non protein nitrogen a condition reminiscent of Mann and Magath's experiments on dogs In spirochaetal jaundice there may be an increase in blood urea owing to coincident damage to the kidney

Pathologically the essential lesion in toxic jaundice consists in damage to the parenchymatous cells of the liver In some instances there is an associated cholangitis When the injurious agent acts upon the liver in massive doses acute necrosis of the parenchymatous cells results and the case is usually referred to clinically as one of acute *necrosis of the liver* acute toxic hepatitis or acute yellow atrophy When the injurious agent is less virulent and reaches the liver in smaller amounts over a greater length of time a much more gradual change is induced in the liver cell and a gradual replacement fibrosis results with the production of chronic hepatitis or cirrhosis of the liver *Thus according to present day conceptions acute yellow* atrophy at one end of the scale and cirrhosis of the liver at the other fall into line A great deal of variation is seen in the post mortem appearances of fatal cases of toxic jaundice Thus in cases of phosphorus poisoning when

* Read in opening a discussion in the Section of Medicine at the Annual Meeting of the British Medical Association Plymouth 1938

the person has survived long enough to have developed jaundice the liver is usually greatly increased in size, doughy in consistency, and yellow in colour When examined microscopically an excessive fatty infiltration, progressing from the periphery of the lobule towards the central zone, is the outstanding feature, and the liver cells, although undergoing autolytic and necrotic changes, are seen to retain their nuclei till a relatively late period In acute yellow atrophy, on the other hand, the liver, except in the most virulent type of case, is found to be reduced perhaps to as much as a third of its normal size, and its capsule shows a wrinkled appearance On section the normal liver pattern can be no longer distinguished, and, except in the most acute cases, red patches sharply marked off from the more general yellow groundwork are a noticeable feature The older the lesion the greater is the predominance of these red areas Microscopically the yellow portions are seen to consist of the remains of liver cells in all stages of disintegration, from parenchymatous and hydropsical swelling with bile precipitation to complete necrosis and fusion of cell remains in which no nuclei can be distinguished The red areas show widely dilated capillaries, engorged and often ruptured, together with newly formed granulation tissue and groups of such liver cells as have survived showing active hyperplasia

Catarrhal Jaundice Obstructive or Hepatic?

Following the teaching of Virchow, ordinary catarrhal jaundice, till recent years, has been regarded as a form of obstructive jaundice Its onset is frequently associated with gastro-intestinal disturbance, and it has been assumed that obstruction arises from inflammatory swelling of the mucosa at the ampulla of Vater or from infection ascending the common bile duct In some cases of catarrhal jaundice ending in death from some other cause a plug of mucus capable of producing mechanical obstruction has been found on post-mortem examination Sir Arthur Hurst has collected quite a few instances from the literature It is pointed out that, while catarrhal jaundice shows itself mostly in the form of sporadic cases, instances of a disease indistinguishable from it clinically, yet occurring in epidemic form, are not uncommon Several members of a family may be attacked, or it may break out in schools, institutions, or barracks It is held to be an infective disease in which damage to the liver cells is the essential pathological lesion, though whether infection occurs by way of the common bile duct or by the blood stream has not been determined

Perhaps I may be allowed to digress for a few moments to mention a few points worthy of consideration in connexion with the epidemic form of the disease The incubation period has generally been regarded as one of a few days, but recent observations would suggest that an incubation period of from three to five weeks is more probable In an outbreak among nurses at the London Fever Hospital in which five cases occurred, twenty-one days appeared to be its duration It is not surprising, with an incubation period as long as this, that persons exposed to a common source of infection and who eventually develop jaundice within three or four days of one another should appear to have infected each other within those few days In some epidemics nasopharyngeal catarrh has been noticed, and there is a certain amount of evidence to suggest that the infection is air-borne from case to case though the actual nature of the infecting material is unknown Cultures of blood, stools, and urine have so far failed to reveal any infecting organism Dr Alison Glover furnished an interesting account of an outbreak of epidemic catarrhal jaundice in a public school of seven houses and some 400 boys in which the evidence appears strongly to suggest that transmission was usually by naso-pharyngeal "droplet" infection and that it was favoured by intimate contact, especially in sleeping quarters That some cases in the outbreak were due to infection by swimming-bath water was possible, but he concluded that in the majority of these cases the initial pyrexia was noticed after, and attributed to, swimming (*Lancet*, 1931, **1**, 722)

But to resume As there appears to be no striking difference between catarrhal jaundice occurring sporadically and cases arising during an epidemic, it has been suggested that all cases of so called catarrhal jaundice are in reality cases of primary liver damage, that is to say, that damage to the liver cell is the fundamental lesion, though it may vary as to severity and extent within wide limits It is only on rare occasions that help in deciding this difficulty can be had from post mortem findings Schrumpf in 1932 obtained a portion of the liver at an operation on the eighth day of what was considered to be a case of catarrhal jaundice, and described the changes found as resembling 'acute yellow atrophy in miniature Gaskell in 1933 had an opportunity of examining a portion of liver from a case of catarrhal jaundice which ended in death from another cause on the third day, and found an acute hepatitis with degeneration of liver cells, and, more recently, I understand that Dr Hugh Barber of Derby has recorded his findings in another case In Gaskell's case the bile ducts showed their epithelial lining to be intact and appeared not to be involved in the inflammatory process

On the other hand, Eppinger (quoted by Hurst), although having previously come to the conclusion that catarrhal jaundice was the result of hepatic disease and was not obstructive, was disillusioned to find the mouth of the common bile duct completely obstructed as the result of inflammatory swelling of its wall in the case of a girl suffering from a typical attack of catarrhal jaundice who had died from a fractured skull On microscopical examination the liver and pancreas in this case were found to be normal Moreover, we have to recognize that even severe damage to the liver can occur without giving rise to jaundice Dr Hugh Barber has reported the post mortem findings in five cases of dioxan (diethylene dioxide) poisoning in factory workers After a fatal illness lasting from five to eight days in no case was there jaundice to indicate liver damage, though, microscopically, complete necrosis of the inner half or often two thirds of each lobule was revealed

The Possibility of Two Forms of Catarrhal Jaundice

When we come to clinical considerations evidence is not wanting of the close association of catarrhal jaundice and acute necrosis of the liver Every general physician of experience encounters from time to time cases of what appears to be ordinary catarrhal jaundice in which, after a shorter or longer period, the patient becomes profoundly ill, exhibiting restlessness and then increasing drowsiness, subsultus tendinum, and what used to be called the "typhoid state," with perhaps purpura or bleeding from the nose, stomach, or kidney Examination shows a greatly reduced area of liver dullness with albumin and casts in the urine, and perhaps leucine and tyrosine in addition In other words, the clinical picture of acute yellow atrophy or necrosis of the liver is revealed Sir William Willcox estimates that about 0·4 per cent of cases of catarrhal jaundice end in this way This being

so must every case of catarrhal jaundice be regarded as a potential case of acute yellow atrophy? Possibly the pendulum has swung too far Hurst meets the difficulty by suggesting that there are really two forms of catarrhal jaundice (1) catarrhal jaundice proper in which blocking of the common bile duct occurs secondary to an acute gastro duodenitis (2) mild forms of subacute hepatic necrosis In distinguishing between these two forms stress is laid on the mode of onset In the obstructive form the initial symptoms are those of an acute gastritis—epigastric discomfort complete anorexia nausea vomiting if the patient eats and sometimes diarrhoea He feels ill and the temperature is raised In two or three days improvement sets in and just when he thinks he has almost recovered the urine becomes dark the stools pale and the conjunctivae and skin jaundiced The temperature now falls and by the time jaundice has fully developed he feels perfectly well except that he is nauseated and vomits if he partakes of fatty food At this stage epigastric tenderness has disappeared though the liver may be slightly enlarged and tender and the gall bladder and spleen may be palpable The jaundice generally begins to fade within a week and by the end of a fortnight all symptoms and signs have disappeared Occasionally the jaundice lasts longer, and in rare instances may persist for two or three months

In the second type—mild subacute hepatic necrosis—Hurst states that no pre icteric symptoms of any kind are found in most cases but the patient notices that his urine is becoming dark and subsequently that the stools are pale and jaundice then appears The onset of jaundice is accompanied by symptoms of general toxaemia headache weakness anorexia with occasional vomiting and diarrhoea The temperature is generally slightly raised There is no epigastric tenderness though the liver may be tender and slightly enlarged and the spleen is always palpable The jaundice is generally less marked than in the first variety and some bile is always present in the stools The jaundice may last between a week and two or three months In rare cases the disease is not arrested and death results from subacute hepatic necrosis or at a much later date, from cirrhosis of the liver

Personally I find a little difficulty in agreeing to the statement that no pre icteric symptoms of any kind are found in most cases of this type I admit that my experience is of necessity limited for a physician rarely has an opportunity of seeing cases at the initial onset of the disease but in cases that I have seen of epidemic catarrhal jaundice the attack has been ushered in with fever four or five days before the jaundice appeared, while nausea, vomiting anorexia, headache and discomfort in the upper part of the abdomen have shown themselves in the pre-icteric period How these manifestations are to be distinguished from the symptoms of acute gastritis which Hurst emphasizes as preceding the other variety—the obstructive form of catarrhal gastritis—I find it hard to determine I am not convinced that the two forms of the disease do not exist but I find it difficult from a consideration of the mode of onset to get much help in distinguishing between these two types of so called catarrhal jaundice If I were pressed to try to distinguish between them I should stress the greater depth of jaundice and the paler colour of the stools as favouring a blocked duct and the enlargement of the spleen as being more constant in mild subacute hepatitis On theoretical grounds one would expect in the early stages of a blocked duct a prompt direct van den Bergh reaction and a biphasic reaction in the case of the mild subacute hepatitis but I doubt if the test is reliable enough to be trusted to cut the Gordian knot Perhaps more may be claimed for the laevulose tolerance test more especially the new test as described by Stewart Scarborough and Davidson in the April (1938) number of the *Quarterly Journal of Medicine* (p 229) but only four cases out of eight of catarrhal jaundice investigated gave abnormal curves and it is interesting that in the case giving the highest icteric index—164—normal curves were obtained for both laevulose and total sugar

Speculations concerning a Progressive Lesion

Before concluding there is one other point I should like to touch upon Addis in his studies of Bright's disease has clearly shown the existence of long latent periods following an initial damage to the kidney (as by acute nephritis) when for years the affected person apparently remains in perfect health In spite of this careful tests of renal function have demonstrated the presence of a relentlessly progressive lesion which finally terminates in renal insufficiency and uraemia Bloomfield in the April number of the *American Journal of Medical Sciences* (p 429) raises the interesting speculation whether something of the same sort may not hold in cases of hepatitis supporting his contention by the fact that many people who have suffered from an attack of catarrhal jaundice show evidence of impaired hepatic function in the form of a high bilirubin content Certainly one comes across cases of relapsing subacute hepatitis in which after perhaps three or four attacks of jaundice spread over a couple of years the final attack is attended by signs of portal congestion ascites developing as in cases of multilobular cirrhosis before the final exitus The speculation raised by Bloomfield makes one wonder whether a progressive though silent change of this sort may possibly explain the varying effect that alcohol exerts on different people While some can partake of large quantities without apparent harmful effect others gradually show indications of liver damage It is a subject worthy of investigation

Finally may I say what a real contribution to clinical medicine would be made by anyone who would place on record the details of even a few cases of catarrhal jaundice followed from its onset to its termination

I have only had time to put before you general conceptions of jaundice and to consider in any detail one form, and that the most common of toxic jaundice but many other aspects and varieties of toxic jaundice will be dealt with by succeeding speakers

---

The Executive Committee and the Council of the International Union against Tuberculosis whose secretary general is Professor Fernand Bezancon President of the Academy of Medicine met in Paris at the headquarters of the Union 66 Boulevard Saint Michel last month under the chairmanship of Professor Lopo de Carvalho (Portugal) Delegates from sixteen countries attended this meeting The administrative meeting of the Council was devoted to the preparation of the programme of the conference to be held in Berlin in September 1939 The agenda of this conference is now definitely settled and will include the following three subjects the problem of the virulence of the tubercle bacillus the value of systematic examinations for the diagnosis of pulmonary tuberculosis in subjects over 15 years of age and the rehabilitation of the tuberculous At the scientific meeting of the Council Professor Frolich (Norway) occupied the chair Drs Maingot Cottenot and Etienne Bernard submitted a report on radiological sections of the thorax and their value in the diagnosis of pulmonary tuberculosis with diagram and radiographs illustrating this subject Before these sessions a meeting of the After Care Committee of the International Union against Tuberculosis (secretary Dr Bachmann Switzerland) had been held under the chairmanship of Sir Pendrill Varrier-Jones.

METHODS OF TESTING FOR COLOUR VISION AND THEORETICAL DEDUCTIONS FROM OBSERVATIONS ON COLOUR VISION*

BY

H. E. ROAF, M.D., D.Sc

George Holt Professor of Physiology, University of Liverpool

Colour Discrimination

As the result of the work of many observers it has been established that in the spectrum there are two main maxima of colour discrimination, corresponding to the sensations of yellow and of blue-green. There may be some doubt as to the existence of one or more additional minor maxima (Corbett, 1936; Wright and Pitt, 1934). The method by which these conclusions have been established is by exposing two identical regions of the spectrum alongside each other and altering the wave-length of one until the two do not appear to match even after adjustment of the intensities has removed any difference in brightness.

At the two main maxima of discrimination the two lights can be recognized to be of the same colour in spite of differences in brightness, while at other wave-lengths a difference in brightness will cause a difference in colour even if the wave-lengths are the same (Roaf, 1927, 1932a, Corbett, 1936). These two spectral regions have been studied to find out whether the sharpness of discrimination is related to any special recognition of these colours when there is no fixed wave-length with which to compare the colour.

Yellow Sensation

The subjects were asked to set a spectroscope so that the field of view appeared to them to be yellow. They were asked to alter the wave-length until the light seemed to be slightly tinged with orange, then to alter back until the light appeared to be slightly tinged with green. The wave-length difference between these two extremes measures the "range" of the "yellow" part of the spectrum, and the mid-point between the two wave-lengths can be called 'mid-yellow'—that is, the centre between the two points where yellow just begins to be tinged with the next colour in the spectrum should be the purest 'yellow' in the spectrum.

As the result of the examination of 100 individuals it was found that eighty-seven normal persons showed an average "range" of 67 ± 29A° and the "mid-yellow" was at 5853 ± 38A°, while thirteen of the subjects had defective colour vision and possessed an average 'range' of 314 ± 168A° with a 'mid-yellow' at 5547 ± 237A° (Hailwood and Roaf, 1937–8). The narrower the "range" of wave-lengths over which the colour is seen the greater is the power of discrimination. These figures confirm the conclusion, arrived at as the result of measurements of discrimination, that those with defective colour vision do not show a maximum of discrimination in the "yellow" region of the spectrum.

Blue-green Sensation

Comparable observations were made in which the subjects were asked to mark out the "blue-green" region by making the field first distinctly bluish and then distinctly greenish. The average "range" of the 'blue-green' was 61.7 ± 34.4A°, and the 'mid-blue-green' was situated at 4926 ± 51A° for 100 cases. Of these cases nine had defective colour vision as shown by the Ishihara test. These nine persons gave an average "range" of 81 ± 54A° with a 'mid-blue-green' of 4965 ± 67A°. These figures confirm the conclusion that those with defective colour vision have no difficulty in distinguishing colours produced by this region of the spectrum (unpublished experiments by Mrs. J. C. Hay).

We cannot say that there are not individuals who have defective colour vision for this region of the spectrum, as ten cases showed a range of more than 100A° (one actually 207A°), but only one of these was classified as having defective colour vision. The reason may be that the Ishihara test is designed to detect the usual type of red-green confusion, hence it might not detect a failure to discriminate in the 'blue-green' region of the spectrum. The mere width of the 'range' does suggest a lower degree of discrimination by these subjects in this region of the spectrum, provided they have realized that the first clearly recognized difference in colour should be noted. The recorded figures are the medians from five separate readings for each limit of "range".

Tests for Defective Colour Vision

The importance of colour recognition for railway, marine, and aeroplane signalling has led to the use of many methods of testing. Of these the fundamental method is some form of lantern, as the recognition of coloured lights is necessary in all the above services (Edridge-Green, 1920). Owing to the low visibility of 'blue' light and the deficiency in 'blue' rays of many sources of illumination not much attention has been paid to the distinction between blue and green. ('Signal green" is really a 'blue-green' allowing all the spectrum except the 'red" to pass through.) The distinction is between red, yellow, and green. (White is not distinguished from yellow because many sources of light—for example, a paraffin lamp—are really yellow.)

Distinction between different degrees of defective colour vision may be made by using diaphragms of different areas, by altering the intensities of the light, and by changing the duration of the exposure of the light (Guttman, 1907, 1908). The duration of the exposure requires further study, and a preliminary examination of this factor has been made by Corbett and Roaf (1937). The new lantern devised for testing colour vision in the Navy makes use of the variations in area and intensity but does not change the duration of exposure.

By means of the spectroscope we can measure the extent of difference in wave-length necessary to produce a recognizable difference in colour in the 'yellow" region. "Ranges' greater than 100A° suggest defective colour vision, but all subjects with these 'ranges" do not make mistakes with the lantern or other tests.

The Nagel anomaloscope based on Rayleigh's observations (1881) enables us to test the match between a fixed "red"+a fixed 'green" with a fixed "yellow'. In the examination of 100 subjects all those (thirteen in number) who made abnormal readings could be classified as possessing defective colour vision, and all those who made the match within the normal range had normal colour vision. It is difficult to reconcile these results with the statement made that those with dichromatic vision will agree with the normal match but will also agree with an abnormal match. Perhaps there is some systematic defect in the anomaloscope method, otherwise some of the

* Paper read in the Section of Physiology and Biochemistry at the Annual Meeting of the British Medical Association, Plymouth, 1938.

subjects should have made settings in the normal region Perhaps these subjects with defective colour vision were not dichromatic cases but in that event defective colour vision does not correspond to dichromatism On the other hand Pitt (1935) gives matching curves with two colours by subjects with dichromatic vision There seems to be some need for an explanation of the fact that persons with defective colour vision are not always satisfied with the match made by a normal person

Pseudo isochromatic Plates

The introduction of coloured plates on which a normal person could see a design which was not visible to the individual with defective colour vision was due to Stilling Ishihara's plates are probably the best to use Dr Collins found that in an examination of 379 persons no normal persons made a mistake with No 2 3 7 8 or 9 and that no individual with defective colour vision could see the number read by the normal person in No 6 or 11 The degree to which the other plates were reliable in distinguishing normal from abnormal subjects is given (Collins 1937)

Ishihara's plates are formed of small disks which vary in area and in purity of colour so that when they are made into a design this can be recognized only by the colour Any recognition of the design by differences in intensity is rendered impossible because the same colour may be present in different degrees of purity—that is, with more or less white in it—so that the disks appear paler or darker In addition, the variation in area of the disks tends to confuse anyone who does not recognize the difference in wave length composition of the reflected light

The whole test is based on the outstanding psychological value of red for the normal person while the individual with defective colour vision cannot distinguish red from green As those with defective colour vision can distinguish blue from green blue is introduced to make designs which are not noticed by the normal person because of the outstanding effect of red on him

The reason why a person with defective colour vision sees a different design from that seen by a normal subject is that he classifies the colours differently, as shown in the following table

	Colours classed together	but distinguish d from
Normal person	Yellow red or vermilion and blue red or carmine	Yello w-green and blue-green
Person with defec tive colour vision	Vermilion and yello w-green	Carmine and blue-green

The only exceptions are plates 12 and 13 which are said to distinguish red blindness from green blindness" Two red figures are seen on each of these plates by the normal person If red as such is not distinguished neither number will be seen as can be proved by looking at them through a blue green light filter One figure in each case is vermilion and lighter in shade than the other which is a dark carmine or mauve The blue in this latter makes it look to the normal person more like the blue grey of the background spots The vermilion number is said to be seen by the green blind while the mauve number is said to be seen by the red blind

This difference may be due to a decrease in sensitivity to the red end of the spectrum in scoterythrous (protanope) cases

The vermilion disks reflect mainly red" light the mauve disks reflect 'red and blue light, hence a decrease in sensitivity to red will cause a greater relative decrease in brightness of the vermilion disks The number formed by the vermilion disks may thus fade into the background The mauve disks reflecting blue light may not be so much decreased in brightness because of the blue light reflected hence the number formed by the mauve disks becomes visible The number seen by the green blind actually reflects less blue than that seen by the red blind

Up to the present no evidence has been brought forward to explain why different numbers are seen in plates 12 and 13 by different individuals with defective colour vision

Binocular Colour Fusion

Each eye can give rise to an independent judgment of intensity colour and shape When both eyes are used combination of the results may occur in a similar manner to that in the spinal cord With low intensities summation is possible as shown by Lythgoe and Phillips (1937–8) At higher intensities occlusion may be present, hence a landscape may appear darker with both eyes than with one eye If a neutral glass is placed in front of one eye that eye being obstructed by an opaque screen it is found that when the opaque screen is removed the landscape appears darker whereas it ought to appear brighter because the impulses from the unobstructed eye are reinforced by further impulses from the eye which has just been exposed by removal of the screen This effect is observed over a certain range of illumination If the neutral glass is too opaque or too transparent the difference in darkness is not observed This experiment suggests some sort of compensation between the impulses coming from the two eyes which of course, is analogous to occlusion

By presenting different colours to each eye it is possible to obtain an addition of the sensations very similar to the result of simultaneous stimulation of one eye by the two colours Thus if the intensities of the two colours are properly adjusted a red screen in front of one eye and a green screen in front of the other produce a yellow sensation (McDougall 1901) This shows that the sensation of yellow is due to fusion behind the optic chiasma and that Hering's hypothesis cannot be true of retinal processes although it may apply to cerebral interpretation of nerve impulses

By such types of experiment it is hoped to be able to distinguish between the effect of different stimuli on common receptors in the eye and the effect of impulses from different receptors on a common interpreting mechanism (Roat 1928 1932b) A practical application of binocular colour fusion might be to train individuals with defective colour vision to recognize colours by the use of a tinted colour filter in front of one eye

Conclusion

In this paper an attempt has been made to point out the difference between normal and defective colour vision, to describe the means of detecting defects in colour vision and the possibility of compensating for defects in colour vision by binocular fusion of colours The usual type of defective colour vision is a failure to distinguish red yellow and green—that is red-green confusion There is no failure to distinguish blue from green We can say that the normal person and the hypochromat distinguish blue from not-blue The normal person distinguishes red from not-red That which is neither red nor blue is called green The hypochromat does not distinguish red from not red, and anything which

is not blue he tends to call yellow, as that is the brightest part in the not-blue region of the spectrum

SOME CARDIOLOGICAL FALLACIES

BY

J. W LINNELL, M D, M R C.P.

Physician Metropolitan Hospital Consultant to the L C C Hospital Service

AND

W A. R THOMSON, M D

First Assistant Medical Unit St Thomas's Hospital Late Paterson Research Scholar and Chief Assistant Cardiac Department London Hospital

Even to-day unfounded beliefs regarding cardiovascular disease appear to be so widespread in the profession that we think it worth while to discuss some of the commonest of them in a short paper

Fatty Heart

For a number of reasons, into which it would take too much time to enter, all obese people tend to become short of breath on exertion On this account alone a diagnosis of "fatty heart' is often made In post-mortem examinations of the obese—and not only of the obese—it is not unusual to find fat stored in and around the heart, but during life its presence can so rarely be proved to give rise to cardiac insufficiency that it is never wise to make the diagnosis When definite symptoms of cardiac insufficiency are present in an obese patient another cause for them should be sought The commonest by far is hyperpiesis, but there are, of course, others

Physical Strain

The belief that a healthy heart can be injured by physical strain still unfortunately persists, in spite of the immense amount of work that has been done on the subject during the last thirty years The truth of the matter has never been better put than by Lewis (1937) when he says It is reasonable to conclude that the burdens imposed by physiological acts upon the normal heart however heavy these burdens may be, never injure the heart and fibres never produce injurious dilatation, and never exhaust the heart's reserve' That the heart tends to be a little larger and rounder than the average in persons who habitually do hard physical work is not denied, but it is a normal and healthy reaction of the muscle to exercise and no more to be accounted pathological than the hypertrophy of, say, their biceps

There is a corollary to this Every now and then one sees a patient in consultation whose heart, according to his medical attendant, has recently dilated enormously within the space of a few minutes or, at most, a few hours, usually, though not always, as a result of effort, and has returned to its normal size, either with rest or through his treatment, just as rapidly Such acute dilatation of the heart, in our experience, never occurs In this connexion it is interesting to observe that in a prolonged attack of paroxysmal tachycardia," in which the heart beats continuously at a rate of over 200 a minute, appreciable enlargement—when it develops—is a matter of several days

Screening the Heart

Even in a patient neither emphysematous nor obese it is impossible to estimate the transverse diameter of a heart with any accuracy by percussion—one has only to screen a normal chest in the lateral or oblique position to be persuaded of this And, supposing it were, no one has ever suggested that the depth of a heart—a very important matter in cases of mitral stenosis, congenital morbus cordis, etc—can be estimated by this means Yet not only can both of these points be elucidated by screening, but a reasonably accurate estimation of the size of each individual chamber of the heart—surely a consummation earnestly to be desired—is as a rule easily made by this means

Displacement of the apex beat to the left, where this cannot be attributed to pulmonary causes, though very suggestive of an enlarged heart, is not absolutely diagnostic Scoliosis, even of so slight a degree as to be only recognizable by radiography, is a fruitful cause of such displacement Again, a high diaphragm—the constant accompaniment of obesity—by causing the lie of the heart to become more transverse, tends to produce it Through ignorance of these facts on the part of medical men, multitudes of healthy people are accounted victims of heart disease who, were their hearts screened by anyone conversant with the technique, could be safely assured as to the integrity of that organ

Enlargement and Dilatation

The heart is generally believed to increase in size with age, as a normal process There is no evidence for this It may even diminish in size When it is found to be enlarged in old age another cause should be looked for—for example, hyperpiesis, bundle branch block, etc

It is almost an article of faith in the profession that in all toxaemic states of any severity there is necessarily some dilatation of the heart through flabbiness of its musculature It is forgotten that in cases of very advanced phthisis where there has been the severest degree of toxaemia for months or years the heart in life usually appears smaller than normal under the screen, and at necropsy is found to be wasted, perhaps, but not dilated Again, in a recent radiological study of 119 hearts in pneumonia by Davies, Hodgson, and Whitby (1935) definite enlargement was witnessed in no more than three

It is, we believe, practically only when auricular fibrillation, auricular flutter, or heart block develops in the course of toxaemia that the heart dilates Circulatory failure, when it occurs in toxaemia, is in our opinion almost always due to loss of contractility of the muscular coat of the peripheral arterioles and not to myocardial weakness

Contrary to common belief in cases of congestive failure the size of the heart does not materially decrease as the signs of failure diminish and disappear A generation ago Mackenzie estimating the size of the heart by clinical methods, came to this conclusion Latterly Palmer (1937) has established the truth of it by radiological methods

Oedema which is not accompanied by enlargement of the heart is practically never cardiac in origin It must be borne in mind however that such enlargement may not be obvious clinically and that radiological examination of the heart may be required before it can be detected—for example in emphysema and obesity

Heart Sounds and Extrasystoles

A heart is often unjustly condemned because in the opinion of the examiner the sounds are weak toneless of poor quality or the like The *character* of heart sounds whether first or second is on occasions of great help in the diagnosis of cardiac conditions but the idea that one can gauge the functional efficiency of a heart by the *loudness* of the sounds is altogether fallacious Dulling of heart sounds is far more often due to obesity or emphysema, or to both than to a feeble myocardium In addition chests possess very different acoustic properties and listeners differ greatly not only in the acuity of their hearing but also in their standards of normality

Even at the present time many practitioners regard extrasystoles as an indication of organic disease of the heart—to the great hurt of their patients As Mackenzie (1918) pointed out extrasystoles are in themselves of no clinical significance and seldom if ever are they harbingers of auricular fibrillation or any other grave cardiac condition After middle age they may be considered almost a normal phenomenon When present in a case of organic disease of the heart—as they often are—they may be safely ignored in assessing the seriousness of the condition and in considering the prognosis

Rheumatism

It is well known that acute rheumatism is comparatively rare in adult life It is not so well known that a first attack which develops after the age of 20 seldom causes permanent damage to the heart and that below this age the nearer a patient is to it the less likely is his heart to be affected

One is often asked during or at the end of a first attack of acute rheumatism whether the heart of the patient is affected or not It is frankly impossible to answer this question The presence of a systolic bruit at the apex is of little help A transient systolic bruit is a commonplace in any severe toxaemia, and a systolic bruit in a first attack of acute rheumatism may be no more than this moreover a patient in whom at the end of the attack no bruit of any kind whatever is audible may a year or two later exhibit definite signs of valvular disease

The scarring of the valves which follows their inflammation and to which mitral stenosis aortic regurgitation and aortic stenosis are due, is a slow process and it is almost certainly six months at least and generally much longer before it has advanced sufficiently to produce recognizable signs of these conditions When during the course of a supposedly first attack of acute rheumatism definite signs of valvular disease are discovered it can be laid down with certainty that the patient has had a previous attack even if it has gone unnoticed

Systolic Murmurs

Mitral regurgitation unaccompanied by mitral stenosis seldom if ever occurs as a result of rheumatic endocarditis Contrary to current teaching a *systolic* murmur at the mitral area is the commonest murmur in mitral stenosis not a presystolic This fact has been firmly established in recent years by radiological examination of the heart although Graham Steell drew attention to it as long ago as 1906 It is the long blowing apical systolic murmur in a patient who gives a history of previous acute rheumatism which is especially suspect

Functional apical systolic murmurs are typically short and non blowing in character In no branch of cardiology is fluoroscopy more useful than in determining the significance of systolic murmurs

Dizziness, Faintness, and Syncope

Dizziness faintness and syncope are not *cardinal* symptoms of heart disease That they can occasionally result from it is not denied—unconsciousness for example occurs in some though by no means all cases of high-grade heart block and more rarely at the onset of an attack of auricular fibrillation auricular flutter or coronary thrombosis—but far more often they are symptomatic of a vasomotor disturbance of psychoneurotic origin Neither is exhaustion or a feeling of tiredness a cardinal symptom of heart disease

It cannot be laid down too strongly that the cardinal symptoms of heart disease are two and two only (i) shortness of breath on exertion and (ii) pain, usually retrosternal though sometimes in such situations as we describe elsewhere in this paper

Pain

The pain of angina pectoris is typically retrosternal, not precordial as is commonly believed It tends to radiate across the front of the chest often to the left shoulder and axilla in many cases down the left arm as far as the elbow or even the fingers, sometimes down both arms or down the right arm only and upwards to the neck on one or both sides It may involve the jaw, it may spread to the back it may have other situations and distributions yet hardly ever is it situated below the left breast Wherever it is or whatever its spread, it cannot be laid down too strongly that it is almost invariably brought on by exercise and relieved by rest

The pain in an attack of angina pectoris may vary in different patients or in the same patient at different times from a dull ache to an agonizing feeling of constriction involving the whole thorax It is never "stabbing" in nature

Left submammary pain is very rarely due to heart disease even though it may sometimes extend to the left scapula and, by way of the left supramammary region and left shoulder to the left arm Such pain is persistent aching in character and not induced though it may be increased by exercise It is usually associated with a group of symptoms indicative of physical and nervous exhaustion which have no organic basis (Baker 1930) Such symptoms do of course also occur in patients with cardiovascular disease—for example mitral stenosis or aortic incompetence—for it is only natural that such patients should tend to develop anxiety states

Coronary Thrombosis

One has often found a practitioner doubtful if a coronary thrombosis has occurred in a patient who has

experienced all the typical symptoms, because, on clinical examination of the heart, he can find no changes of any kind whatever It may be interesting for such a one to know that, though a coronary thrombosis can give rise to any of the known arrhythmias, in the majority of cases the rhythm remains regular, no bruits are produced, and no increase in the size of the heart can be demonstrated even by radiological methods

It is commonly believed that an electrocardiogram taken after a coronary thrombosis *invariably* shows characteristic abnormalities This is not so Very occasionally it is normal in every particular Again, a reversed T wave in Leads I and II is not *invariably* a sign of coronary disease It occurs sometimes in severe grades of aortic stenosis and hyperpiesis

Coronary thrombosis very seldom occurs as a result of syphilitic aortitis, in spite of the fact that in this latter condition narrowing of the orifices of the coronary arteries is almost the rule

Some Further Points

That a patient's systolic blood pressure reckoned in millimetres of mercury should equal 100 plus his age in years is still an article of faith in many quarters Mass statistics now available prove that this is not the case The blood pressure should normally rise only slightly with increasing age This is evidenced by the fact that in normal people the increase between the ages of 20 and 60 is no more than 15 mm

Atheroma is never a cause of high blood pressure, though there is little doubt but that the latter ultimately tends to lead to atheromatous degeneration of the arteries

Syphilis never causes a *general* arteriosclerosis The arterial involvement in syphilis is invariably focal

It should always be borne in mind that aneurysm of the thoracic aorta scarcely ever causes dysphagia with regurgitation of food, although it may occasionally be accompanied by some discomfort in swallowing

Auricular fibrillation is, curiously, very rarely associated with subacute bacterial endocarditis or syphilitic disease of the heart

We would acknowledge our indebtedness for many of the points we have stressed to the late Sir James Mackenzie with whom one of us was associated for a considerable time and to Dr John Parkinson with whom both of us have been closely associated in recent years in the cardiac department of the London Hospital

As a result of this year's collection the Metropolitan Hospital Sunday Fund has a sum of £51,000 to distribute The money will be allocated to hospitals, convalescent homes, dispensaries, and nursing associations in the London area At a meeting of the council of the Fund the report of the Distribution Committee was adopted The larger allocations include £3,400 to the London Hospital, £2,[illegible] The St Thomas's £1,950 to the Royal Free, £1,85[illegible] thaiddlesex, £1,800 to University College Hospital [illegible] ysic Guy's, £1,400 to St George's, £1,360 to St Mary's [illegible] to Charing Cross, and £1,190 to King's College Hospital

THE "RESTROPIC" ACTIVITY OF BLOOD

BY

C. WETZLER-LIGETI

AND

B P. WIESNER, Ph D., D.Sc.

In previous publications (Wetzler-Ligeti and Wiesner, 1937, 1938a, 1938b) we have described the effects of various pituitary extracts upon the reticulo endothelial system (RES) of the rabbit Congo-red solution was injected intravenously and the rate at which the dye disappeared from the circulation was determined, this rate has been taken, in accordance with the view of previous authors (Adler and Reimann, 1925, Moncorps and Gunther, 1933, Dieryck, 1929, Stern and Willheim, 1935), as an index of the functional activity of the RES It was found that certain anterior lobe extracts raised the Congo red index by a considerable amount The active substance—termed the positive RES tropic (restropic) factor—is not identical with either gonadotropic or thyrotropic hormone In addition to positive restropic extracts, the anterior lobe yields a substance that rapidly, though only temporarily, lowers the index and thus presumably inhibits the function of the RES This negative restropic factor is closely associated, or identical, with the thyrotropic hormone

These experiments suggested that the RES was subject to endocrine control Since other hormones, such as the oestrogenic and gonadotropic substances, can be demonstrated in the circulation, the experiments have been extended to the examination of blood Some of the results are presented here, in extension of preliminary notes on the subject published elsewhere (Wetzler Ligeti and Wiesner, 1938c, Czato, Wetzler-Ligeti, and Wiesner, 1938)

Method of Extraction

Fresh blood—obtained from the veins of rabbits or human subjects, or from the heart of the horse—was defibrinated by shaking it with beads An equal volume of a 20 per cent aqueous solution of sulphosalicylic acid was added to the defibrinated blood and the mixture was shaken vigorously The precipitate was collected in a centrifuge and taken up in 50 ml of 6 per cent aqueous ammonia The mixture was allowed to stand for twelve hours at a temperature of 37° C It was then centrifuged and the precipitate was discarded. The supernatant liquid was adjusted to *p*H 5 by means of acetic acid, and an equal volume of 90 per cent alcohol was added The resulting precipitate was discarded An equal volume of 95 per cent alcohol was added to the supernatant liquid The precipitate was made up with distilled water to a volume the same as the initial volume of blood The precipitate did not wholly dissolve, and the solution was clarified by centrifuging The whole process was carried to completion within twenty-four hours of collecting the blood sample The extracts were stored at 4° C, as the activity is lost at room temperature

The general properties (solubility, stability, etc) of the active fraction agree with those of the pituitary extracts obtained by similar methods

Determination of Congo-red Index

Stern and Willheim's modification (1935) of the Congo red method (Adler and Reimann, 1925) was again used Virgin rabbits obtained from a commercial breeder were employed in these experiments Uniformity of stock and age is desirable, for although the Congo red index tends only to vary slightly in untreated rabbits (± 5 per cent),

individual differences in the basic level may be pronounced Thus the index in one untreated rabbit may be about 50 while in another individual it may be 30 Generally the basic index is within the range 30 to 50 A fall produced by experimental procedure will be more manifest if the basic index is high than if it is low conversely a rise is more impressive if the basic index is low Animals uniform with respect to origin weight and age must be used in order as far as possible to eliminate these individual differences

The index was determined in each experimental rabbit The first injection of the extract to be tested was then administered subcutaneously During the following days one injection daily was given a total of three to five daily injections being administered In most cases the number of injections was four with a few exceptions (made in the first experiments) 1 ml was administered on each occasion The determination of the index was repeated on the day after the first injection and subsequently as shown in the graphs—that is twenty four hours after the last injection and again after a further interval (eight to ten days)

Results

1 *Rabbit's Blood*—The blood of virgin rabbits contains a considerable quantity of positive restropic substance The response evoked in an immature rabbit by the extract from 10 c.cm of blood of another rabbit of the same age is shown in Fig 1 It will be seen that the index rises

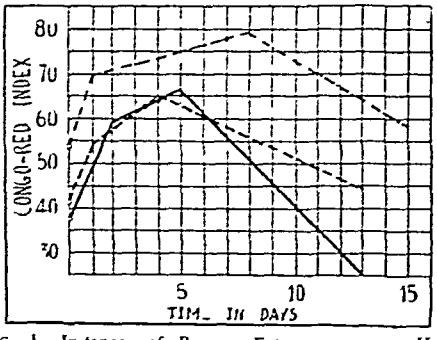

FIG 1—Instances of Positive Extracts ——— Healthy female - - - Bronchopneumonia —— Normal female rabbit (o = first injection ● = last injection Points of inflexion indicate days on which the index was determined)

rapidly but tends to return to the original level after the injection is stopped No general effects were noted

2 *Horse's Blood*—The blood of a slaughtered horse (age unknown) contained small quantities of positive restropic substance The concentration was well below that found in the rabbit The blood of a pregnant mare (seventy first day of pregnancy) was also tested The method of extraction was similar to that used for obtaining positive restropin from the anterior lobe The resulting blood extract was rich in gonadotropic hormone, but did not affect the Congo red index.

3 *Human Blood*—Samples of human blood were collected from forty five subjects This number does not include some cases used in experiments in which the technique was varied or in which the clinical diagnosis was doubtful Of these forty five cases eight were healthy fifteen exhibited various clinical conditions other than malignant disease in twenty two cases malignant disease was established Samples of 5 to 10 ml each were employed hence one rabbit only was used in each experiment In four cases of malignant disease the animals died soon after the first injection, so that no curve can be given

Three types of response were noted and may be described separately

(*a*) *Positive Response*—Two examples of this type are shown in Fig 1 (see also table) It will be seen for instance

Blood Restropin Table

No	Clinical Diagnosis	Before First Injection	After One Injection	After Four Injections	Eight Days after Last Injection
1	Healthy	4.5	55 5	54 0	44 0

Convalescence after surgical treatment
† No determination made on second day
Animal died

that the index rose rapidly in a rabbit that had received injections of the extract prepared from the blood of a normal subject. Before treatment 37 per cent only of the dye was eliminated from the circulation during a period of fifty six minutes Twenty four hours later the rate had risen to 58 8 per cent and it continued to rise to a maximum of 67 3 per cent After stopping the injections the index fell again to a level somewhat below the original The animal bore the injections well. Similar activity was established in other samples of normal blood examined Further examples are shown in the table Positive restropic activity is not restricted to the blood of healthy subjects it was also found in the majority of clinical conditions excluding cases of malignancy Examples are shown in Fig 1 and in the table The response to positive restropic extracts manifests itself rapidly and a raised index is usually found twenty four hours after the first injection But the effect requires several days for its full development

(*b*) *Inactive Extracts*—In eight cases the extracts did not significantly affect the Congo red index the variations being within the normal range Examples are shown in Fig. 3 and in the table It will be noted that the curve resulting from plotting the successive indices against time is nearly straight and horizontal No general effects were noted in the animals.

(*c*) *Negative Restropic Extracts*—In eighteen cases strongly negative effects were observed The index fell rapidly in some cases to less than half its initial measure Examples are shown in Fig 2 and in the table Stopping the injections was followed by a return of the index to *about* its initial level The extracts affected the general condition of the animals More or less pronounced emaciation resulted in some instances the animals succumbed in a cachectic condition after one to four injections Extracts of this type have been obtained from cases of malignant disease only

The type of extract (positive, negative and indifferent, respectively) obtained from blood seems to be related to the subject's condition Positive extracts were procured from eighteen of the twenty three cases who were either healthy subjects or exhibited some clinical syndrome

other than that of malignant disease Negative extracts were obtained from nineteen of the twenty-two cases of malignant disease, when the animals survived to yield definite data Inactive extracts were got from eight cases, including three of malignant disease These findings may be expressed differently by stating that in most cases of malignant disease negative extracts are obtained, whereas in

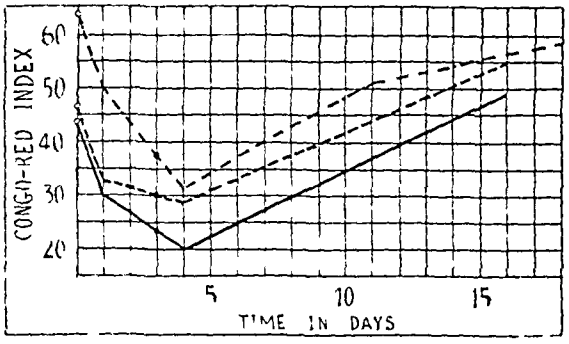

FIG 2—Instances of Negative Curves ——— Carcinoma vulvae -- Carcinoma cervicis — — Carcinoma cervicis (o = first injection ● = last injection Points of inflexion indicate days on which the index was determined)

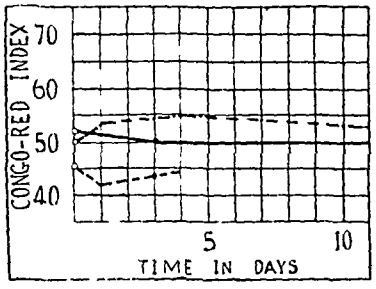

FIG 3—Instances of Inactive Extracts ———, Healthy female — —, Head injuries, - - Carcinoma parotidis (o = first injection, ● = last injection Points of inflexion indicate days on which the index was determined)

the absence of malignant tumours positive extracts result as a rule Inactive extracts may be found in either group, but as yet no case of untreated malignant disease has yielded a positive extract, whereas negative extracts were not found in any case in which the clinical diagnosis excluded the presence of a malignant tumour

Discussion

The rise in the Congo-red index following upon the injection of extracts prepared from 'normal' blood, whether human or animal, is pronounced hence it must be concluded that the blood of healthy subjects contains a positive restropic factor The origin of this substance is obscure although we have not yet detected any chemical or biological difference between the positive restropic factors of human blood and of cattle pituitary, the identity of the two substances and the pituitary origin of restropin in blood are by no means proved Further experiments are required to elucidate this question in their planning it will be necessary to consider the possibility that the restropin of blood is derived from the centres of the RES

The data also show that disease in general, with the exception of malignant disease, does not fundamentally alter the restropic activity of blood As a rule a positive factor is present even in severe non-malignant conditions There are some indications that the concentration of restropin may even be higher in some diseases than in health but a much larger amount of material is required to confirm this observation On the other hand, both in normal subjects and in various clinical conditions the concentration of positive restropin may fall so low that with amounts of extract similar to those used in the present experiments there may be no effect on the RES of the test animal

It is also clear from the data so far obtained that the normal restropic activity of blood tends to be reversed in malignant disease Although some interest attaches to this finding, it must be remembered that we have examined up to the present moment but few types of malignant tumours Hence no general statement can be made as to the kind of malignant disease in which positive activity is lost and negative activity develops, nor is it known at which stage of neoplastic development restropic activity changes

The origin of negative restropin is even more obscure than that of the positive factor In experiments with pituitary extracts negative activity was found to be associated with the thyrotropic factors, in the present experiments no obvious thyrotropic activity was noted to attach to the negative extracts Moreover, these extracts were toxic in many instances—a property not observed in corresponding doses of thyrotropic extracts

The biological significance of the findings under discussion is open to several purely provisional interpretations It could be considered that the RES is involved in the maintenance of immunity and resistance the presence of positive restropin possibly reflects, or conditions, the active state of the system Conversely, the development of negative restropic activity in the blood might tentatively be regarded as a manifestation of a severe disturbance of the function of the RES The fact that negative restropic activity has been demonstrated up to the present time only in cases of malignant disease is possibly significant, for it has long been assumed that the systemic changes that develop in malignant disease extend to the RES, and a voluminous literature concerning this relationship has accumulated Roffo's observations (1929, 1933) are of considerable interest in connexion with our findings He showed that the blood of cases of malignancy could cause increased weight of the spleen in the mouse Roffo concluded that in cases of malignancy changes took place in the lipoid metabolism, resulting in secondary structural and functional changes in the RES Although we have not examined the corresponding effects of their extracts, it should be mentioned that in our experiments the lipoid fraction of blood was almost completely eliminated

It is, however, hardly possible at the present moment to discuss these questions profitably, or to analyse further the problems that suggest themselves, such as the part played by the pituitary, which has been shown to yield both negative and positive restropic extracts There is not even evidence to show whether the lack, or reversal, of positive restropic activity is correlated with the actual presence of a malignant tumour or whether it indicates a systemic change that may either precede or follow, condition or be conditioned by, neoplastic development

Summary

1 The blood of rabbits, of the horse, and of healthy human subjects has been found to contain a factor that stimulates the activity of the reticulo endothelial system (positive restropic factor)

2 Positive restropic activity seems to persist in disease, except in malignant disease, when, as a rule, the normal activity is reversed, a negative restropic factor being found in the blood

We are greatly indebted to Dr P O Ellison pathologist to the Royal Northern Hospital, the staff of the Royal

Cancer Hospital (Free) Dr J Patterson pathologist to Charing Cross Hospital and Dr Rouillard Waterloo Hospital for samples of blood and for clinical diagnoses

TREATMENT OF CARCINOMA IN THE PHARYNX AND LARYNX BY IRRADIATION*

BY

C HAMBLEN-THOMAS, F R C S

Surgeon Ear Nose and Throat Department West London Hospital

In this brief survey I would like to emphasize a few points They are (1) operation should be done where possible (2) all patients undergoing irradiation treatment should be treated as in patients (3) radium has its particular uses and so has x ray treatment

Apart from growths which are better treated by irradiation because of their histology or their position I will say with all emphasis that where (with due consideration of anatomical and histological limitations) an operation can be adequately performed that is the treatment of choice Of course irradiation can be used as an aid to operation but this I will discuss later Speaking generally the results of operation are more satisfactory than those of irradiation alone—partly no doubt because the cases for operation are carefully selected and are not so advanced

The suitability of a growth for irradiation depends on its histological character and its situation If the cells are young and undifferentiated and the growth is rapid and large it is better treated by irradiation because such a growth is radiosensitive and at the same time the results of operation alone are so unsatisfactory On the other hand if an epithelioma is of the more mature type with a good deal of fibrous tissue or has been treated previously by irradiation or operation so that there is an increase in scar tissue it has little radiation sensitivity and is better operated on

Now let us consider the subject with regard to the position of the carcinoma We know that carcinomata arising in certain sites only slightly removed from others are especially sensitive to irradiation treatment and the results are good The tonsil if the growth has not become adherent to the more solid structures is particularly suitable for interstitial irradiation My cases were all rather advanced and all had glands but excluding one patient who is alive and well after seven and a half years the average life is eleven and a half months for all

Intrinsic carcinoma of the larynx if it has not spread posteriorly to the arytenoids or anteriorly to the epiglottis is particularly susceptible to irradiation—so also is epithelioma of the soft palate—and there is no resulting deformity or alteration of voice Firm fixation of the growth and involvement of muscle and cartilaginous or bony tissues are indications that irradiation alone will not be successful Here are Coutard's figures for 1937

Epithelioma of palate tonsil and pillar region	66 cases	32 5 year survival
pharynx	26 "	11% " "
larynx	16 "	—" " "

In comparing results five years is a useful period to take but at this point I would like to mention that our President in 1934 had a case of carcinoma of the larynx which had recurred twenty four years after operation It was successfully treated by irradiation

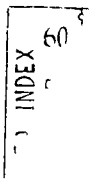
If there are glands present the results of irradiation are not so good Glands are more resistant than the primary growth five of my series of eighteen cases of extrinsic carcinoma of the larynx which have lost the primary growth still have glands that can be felt Unfortunately nearly all the cases we see have glandular enlargement except of course the intrinsic carcinomata

Though metastases are associated with irradiation treatment I am aware of no grounds for saying nor has it been proved that metastases are *encouraged* by irradiation The survival period of the patient is increased by irradiation which also is so often employed as a forlorn hope for extensive and inoperable cases All it can do in such cases is to heal an ulcer stop haemorrhage and pain and otherwise ease local discomfort.

Comparative Results

In comparing results we must also remember that operation cases are of necessity hospitalized whereas many of those treated by irradiation attend as out patients and are ill clad under fed have dirty mouths and have to travel home after each treatment in all weathers There is no doubt that very much better results would be obtained with irradiation if the patients could be taken into hospital The statistics of private patients bear out the above facts

Irradiation has its uses in combination with operation It destroys the young and active cells of the growth and renders an adherent growth more movable Coutard advises operation before the twenty fifth day after irradiation—that is before the reappearance of any new cells and any skin reaction Hautant also advocates irradiation before operation Although some believe they have had better results from their operations by using irradiation afterwards Coutard is not much in favour of it it is the scar tissue that limits the usefulness of the radiation in these cases



Methods of Irradiation

With reference to the different modes of irradiation I limit my treatment to the use of radium needles or radon seeds and those requiring external irradiation I refer to Mr Carter Brain or Mr White Phillips On the whole I think I get better results with radium needles than I do with radon seeds The dosage of the latter I feel is initially uncertain and radium needles give just as big a dose at the end of the week of insertion when it is wanted most

Care is required in the spacing of the needles if they are to be completely effective also the results are better if there is a previous wide external application of radiation Interstitial irradiation with needles is more effective than external irradiation in the treatment of the older cell type of growth Needles are indicated particularly in carcinoma of the tonsil soft palate and intrinsic carcinoma of the larynx using the fenestration method Harmer has had a 75 per cent five year survival result One of my patients is alive and well after eight years

concen

facility in passing through narrow and Eckman (1935) proved exp to 50 per cent less pressure was required helium-oxygen mixtures Eversole (1937), using in ure clinically in seventy-two patients with respir obstruction, claimed nearly 90 per cent of successful results It has also been used in the treatment of bronchial asthma and in respiratory paralysis due to spinal anaesthesia

The British Oxygen Company very generously presented one of us (W S S) with a ten cubic foot cylinder of helium, which until recently was unobtainable except in the United States The company can now supply it This was tried in half a dozen cases during cyclopropane anaesthesia, but as the patients had no respiratory obstruction and were already breathing with the remarkable calmness and quiet typical of cyclopropane it had no apparent effect

Personal Experiments

As no patients with respiratory difficulties were available personal experiments were carried out with artificial obstructions

A Foregger-Waters soda lime canister and rebreathing bag were used The face piece was replaced by an intratracheal adapter, to which was fitted a rubber mouth piece which carried a screw clamp This clamp was tightened until considerable constriction was caused Actually a Magill tube of 5 mm internal diameter was compressed until the lumen was about ½ mm wide and 8 mm long The subject then breathed in and out of the bag through the soda lime and through the constriction A quarter of a litre of oxygen per minute was allowed to enter the bag through a flowmeter, while the expired carbon dioxide was of course removed by the soda lime

In one series of experiments air only was used, in the other a helium-oxygen mixture of approximately similar percentage. In every case the subject breathed through the constriction until dyspnoea became intolerable The times were taken by stop-watch

In each experiment with helium the bag was emptied and refilled after the first half dozen breaths in order to get rid of some of the residual nitrogen from the lungs By refilling the bag several times it might be possible to improve upon our figures

As we were using ourselves as subjects we disregarded Home Office regulations about killing the experimental animals at the close of the session This led us into a trap which invalidated our first series of results We tried to obtain many readings in one evening, and very soon found that the fatigue caused by semi strangulation produced increasingly rapid intolerance to a repetition of the process

The times given below were all taken after allowing a sufficient interval complete recovery The constriction caused by screw clamp remained constant throughout

HELIUM IN ANAESTHESIA

BY

W STANLEY SYKES, M B , D.A.

Anaesthetist to the General Infirmary the Hospital for Women and St James Hospital Leeds and to the Dewsbury Infirmary

AND

REGINALD C LAWRENCE, M B , Ch B

Resident Anaesthetic Officer the General Infirmary at Leeds

Helium, like nitrogen, is a physiologically inert gas But it is very much lighter An artificial atmosphere of normal oxygen content (21 per cent), but with 79 per cent of helium replacing the normal nitrogen, is only one third as heavy as ordinary air It should require only one-third the amount of force to move it (force = mass × acceleration) and it should pass through narrow apertures twice as easily (the rate of diffusion of gases is inversely proportional to the square root of their densities)

Helium–oxygen mixtures have been suggested for deep-sea divers and caisson workers because of their rapid diffusibility (and low coefficient of solubility), which allows of quicker passage from the blood to the alveoli and consequently quicker decompression Sayers and Yant (1926) found that small animals subjected to pressures of 10 atmospheres for one to five hours could be decompressed from helium–oxygen in one third to one quarter the time required for nitrogen–oxygen

Lemmer and Rovenstine (1935) proposed putting this low solubility to practical use in anaesthesia Their experiments on different gases (with the object of preventing post operative atelectasis) showed that its actual absorption from the alveoli into the blood was the slowest of nine different gases tested But it has another potential

No 2 subject R C L Aged 27 non smoker

Nitrogen-oxygen	Helium-oxygen
5 min 2 sec	9 min 30 sec
4 min 40 sec	9 min 10 sec
4 min 10 sec	10 min 21 sec
4 min 36 sec	8 min 54 sec
3 min 58 sec	8 min 20 sec
Average 4 min 33 sec	Average 9 min 15 sec

Probably the slightly better times obtained by subject No 2 are accounted for by difference in age and smoking habits His fifth experiment which was easily his worst was done shortly after exercise The results are on the whole very consistent

Conclusion

An artificial atmosphere of helium and oxygen is theoretically and practically about twice as easy to breathe as ordinary air and the mixture should be of great value in cases of respiratory obstruction or in cases in which it is essential to economize muscular effort When obstruction is present its value is immediately apparent and can be measured by simple timing experiments Even if there is no obstruction in which case it has no visible effect it might still be of value in reducing the amount of work done by the patient and in preventing post operative collapse of the lung because of its low solubility

CARDIAZOL THERAPY IN STUPOR

BY

J S HARRIS, M D, M R C P, D P M

Deputy Medical Superintendent West Park Hospital Epsom Psychiatric Consultant St Stephen's Hospital and Westminster Institution London

AND

C R BIRNIE, M D, M R C P, D P M

First Assistant Medical Officer West Park Hospital Honorary Psychotherapist and Honorary Psychotherapist to Speech Department West End Hospital for Nervous Diseases London

The treatment of schizophrenia by cardiazol has been practised on the Continent to an increasing extent in recent years and the view is current that a favourable response is often met with in cases of stupor In the present series eighteen cases of stupor were treated and in their selection no special criteria were employed Each case however was carefully examined to exclude organic disease The stupor although it varied in depth was the outstanding clinical feature in each case

Technique of Injection

The technique employed was that recommended by Meduna A 10 per cent solution of cardiazol buffered to *p*H 8 with 0 1 per cent disodium hydrogen phosphate to prevent decomposition on sterilization was injected intravenously beginning with 0 5 gramme in the case of men and as a rule 0 4 gramme in the case of women Three injections were given weekly and the dose was increased by 0 1 gramme whenever it was found that a larger amount was required to produce a convulsion It was never necessary to employ a higher dosage than 1 gramme It was decided to produce in each case thirty convulsions unless some complication supervened It is well known that thrombosis is one of the difficulties to be contended with and therefore if only one or two veins be available (and this is not uncommon in women) treatment may have to be abandoned at an early stage With a view to preventing this occurrence the solution of cardiazol employed was buffered and in addition all traces of the drug were removed from the needle by rinsing in normal saline before insertion into the vein Further after the injection had been given any extravasation of blood into the tissues was prevented by firm pressure by means of a swab at the site of puncture and this was maintained throughout the convulsion As soon as the latter was over a dry dressing was firmly applied No attempt was made to thread the needle up the vein as this appeared likely to increase the possibility of thrombosis

Results

The total number of patients treated was eighteen of whom eleven were males and seven females In eleven cases thirty convulsions were produced and this was held to constitute a full course of treatment In the remaining seven cases for one reason or another (see below) it was found necessary to discontinue treatment after the production of from three to nineteen convulsions In the table below are set out particulars of the cases It will be noted that Cases 1 to 11 received the full course of treatment while in Cases 12 to 18 treatment was incomplete for the reasons assigned

Table giving Particulars of Eighteen Cases of Stupor Treated by Cardiazol

Case No	Sex	Age	Duration of Illness	Duration of Stupor	Type of Stupor	Dose in grammes	No of Convulsions	Result	Remarks
1	M	20	3 years	1 12	Non resistive	0 5 0 7	30	Complete remission	
2	M	28	1 "	1	Resistive	0 5 1	30		
3	F	23	1 3/12	1/12		0 4- 0 7	30		
4	M	23	4/	1/12	Non resistive	0 5 0 8	30	Partial remission	
5	F	23	5	3/12	Resistive	0 4- 1	30	"	
6	F	22	6	2 3/12		0 5- 0 8	30		
7	F	47	10	10	Non resistive	0 3- 0 8	30	"	
8	M	44	4	3/12		0 5- 0 8	30	No change	
9	M	28	5	3		0 5- 1	30		
10	M	30	3	3	"	0 5- 1	30		
11	M	32	7	2	Resistive	0 4- 0 7	30		
12	M	36	1 1/2	1 3/12		0 5 1	19	Partial remission	Marked hostility
13	F	47	13	4	"	0 5 0 7	7		Treatment being carried out
14	F	31	3 1/2	3		0 5 0 6	4		Thrombosis of veins
15	M	28	2	2	Non resistive	0 5 0 7	9	No change	Activation of pulmonary tuberculosis
16	M	27	3	3		0 5- 0 8	8		Thrombosis of veins
17	F	30	3	4/	Resistive	0 4- 0 6	4	"	"
18	M	35	1/2	4/	Non resistive	0 5- 0 6	3	"	Numerous after convulsions

Reference to the table will show that of the eleven cases which received a full course of treatment three made a complete recovery four showed some improvement and the remaining four did not benefit As is to be

expected, and as others have stated, there is a definite correlation between the duration of the mental disorder and response to treatment, those cases with the shorter duration improving to a greater extent than those in which symptoms have been present for a longer time In the three cases which recovered the average duration of illness was under two years, in those in which only a partial remission or a complete failure to respond was obtained the average duration of symptoms was over five years

It is noteworthy that, of the cases which recovered, Case 1 was considered to be one of depressive stupor, whereas Cases 2 and 3 were undoubtedly examples of schizophrenic stupor In all three the stupor was profound, and in Cases 2 and 3 it came on abruptly It seems that it is in these cases, where a deep stupor has appeared suddenly and has not been preceded by a phase involving schizophrenic deterioration, that the best results may be anticipated The fact that in Case 1 there was a relatively long duration of illness before the onset of stupor does not contradict this suggestion, since in that instance the illness was considered to be essentially depressive in type and therefore no deterioration was to be expected

In order to discover whether such deterioration is present in any given case of stupor before treatment is begun, a colleague, Dr W P Berrington, has suggested the employment of sodium amytal This drug in many cases causes the patient to emerge from his stupor for a short time, during which it is possible by questioning and observation to detect the presence of any deterioration It is also possible that sodium amytal may be useful in another way, since it seems likely that unless it produces the above effect treatment with cardiazol will not lead to good results

In those cases where stupor was deepest a few injections only were necessary to produce dramatic results, particularly in relation to mutism and refusal of food As an example of this Cases 13 and 14 can be quoted In the former the patient had been stuporous for four years and mute and refusing food for two years Three injections were enough to make the patient sit up, converse, and feed herself In Case 14 the patient had been stuporous, mute, and refusing food for three years Again three injections led to the patient sitting up, speaking, and feeding herself

Complications Observed

1 THROMBOSIS

In spite of the precautions (see above under heading of technique) which were taken thrombosis of the veins did occur in a number of cases, and in three of these to such an extent that it was impossible to continue treatment In these cases the number of injections given was very small —namely, four, four, and eight respectively It is noteworthy, however, that in some of them it was possible to give as many as fifteen injections into the same vein without any apparent thrombosis occurring, and this would appear to suggest that a personal factor is involved Occasionally, after thrombosis had occurred in a vein, if an interval were allowed to elapse it was found that the vein could again be used successfully

2 DISLOCATIONS

(*a*) *Forward Dislocation of the Jaw*—This occurred in two patients, and took place at the beginning of the fit when the muscles of the jaw, along with others, were in tonic spasm The reduction of the deformity was easily carried out immediately after the fit had ceased, during the stage of relaxation It was found possible to avoid a recurrence of the dislocation in subsequent seizures by instructing the nurse to prevent the lower jaw opening too wide by pressing upwards with one hand placed under the chin while exerting counter-pressure with the other on the vertex This pressure may be discontinued as soon as the tonic spasm is over, and the gag or tampon is then quickly placed between the teeth

(*b*) *Subcoracoid Dislocation of the Shoulder*—This happened twice during the tonic stage of the fit in a patient who gave no history of any previous dislocation at this joint Reduction presented no difficulty

3 ATYPICAL FITS

(*a*) *Delayed Fits*—In the majority of cases the convulsion occurs about fifteen seconds after the injection of cardiazol into the vein In a few cases it is found that this interval is constantly exceeded, and a period as long as two or three minutes may elapse So far as could be ascertained, in those cases all the cardiazol went into the vein In one case it was known that the greater part of the cardiazol went into the surrounding tissues, and in this instance a seizure occurred, but not until fifteen to twenty minutes had elapsed The longer interval is presumably accounted for by the slower absorption, which prevented the cardiazol from quickly reaching the concentration in the blood necessary for the production of the seizure

(*b*) *Weak Seizure followed by a Strong*—In one case on almost every occasion the injection of cardiazol was followed by a slight fit, and then, after an interval of up to a minute, the major convulsion occurred

(*c*) *Strong Seizure followed by a Weak*—In two cases immediately after the patient had had a strong seizure and was in a state of relaxation a second much weaker fit followed

(*d*) *After-convulsions*

(i) Convulsive Twitchings—In one case where the veins were partially thrombosed an injection of 0·7 gramme into an arm was followed by a ballooning of the vein, and as no fit occurred a similar injection was given into the other arm, with the same result Finally, a patent vein was chosen, and when another 0·7 gramme was injected a strong fit occurred, but throughout the next twenty-four hours this patient continued to have generalized convulsive twitchings accompanied by periodic vomiting The cardiazol which was injected into the first two partially thrombosed veins was possibly absorbed so slowly that the concentration in the blood failed to reach that necessary to produce a major convulsion, but was sufficient to give rise to generalized twitchings

(ii) Numerous Severe Seizures—Case 18 (see table) is of great interest Following the first injection of 0·5 gramme of cardiazol a strong seizure occurred and was followed after an interval of three minutes by another not quite so strong Three days later a second injection of the same amount produced no reaction On the third occasion 0·5 gramme again produced no reaction, so the dose was immediately repeated, with the result that a strong seizure occurred, followed almost at once by three more strong seizures Later in the day the temperature rose to 101° and the patient appeared ill On the next occasion, since 0·5 gramme had previously failed to produce a fit, 0·6 gramme was given without result As before, this was immediately repeated, and was followed by the occurrence of seven fits at intervals during the next twenty-four hours It was decided, in view of this, to discontinue further treatment

ACTIVATION OF PULMONARY TUBERCULOSIS

Case 15 in which there were no clinical symptoms or signs of a pulmonary lesion before treatment was begun showed after the ninth injection an evening rise of temperature with clinical evidence of a right apical lesion which has subsequently progressed rapidly It is possible in this case that had a skiagram of the chest been taken before treatment the presence of a quiescent focus would have been discovered contra indicating treatment Such an occurrence suggests the advisability of screening the chest in every case before treatment is undertaken

The results of treatment described above must not be considered to be final as relapse may yet occur in some of the cases Indeed in one (Case 5) which had received a full course of injections and had had thirty convulsions resulting in a partial remission there are already signs of relapse and this in spite of a further short course of injections

Conclusions

From the results it would appear advisable to treat every case of stupor whether of long or short duration with cardiazol Complete recovery or improvement may be expected in those cases in which the illness has lasted a relatively short time and in which the stupor has been almost the earliest symptom Even when underlying deterioration is masked by stupor the latter will disappear with cardiazol therapy but the former will become evident Apart altogether from the question of remission refusal of food and consequent tube feeding in cases of stupor should be almost completely eliminated by cardiazol therapy

We would like to thank Dr N Roberts medical superintendent of West Park Hospital for permission to publish the details of the cases

Clinical Memoranda

Suicide after Treatment as Voluntary Patients

During the last fifteen months four women between the ages of 30 and 38 who had been married for from eleven to eighteen years, have entered this hospital as voluntary patients left in a month and committed suicide within a few days of leaving—three by coal gas and one by drowning Their cases bear such strong resemblances to each other as to necessitate being recorded as a group

DESCRIPTION OF CASES

In three cases there was no suspicion of mental illness in the family in the other the mother and one brother (out of five siblings) had each been in a mental hospital for a period There was nothing of interest in their early histories except a tendency to obsessional traits All had carried out the duties of a housewife with conscientiousness for many years They were all non-smokers and only one took a little stout occasionally as a tonic They were or had been regular church goers and all had strong religious feelings One had no children two had one each and the other had four

In two cases the illness was the first attack Of the others one had had mild symptoms six years before and one had experienced during the last fifteen years six attacks of apathy and depression lasting a few weeks Menstruation in each case lasted five to six days and was regular and rather full Their symptoms were generally worse during these periods Their sexual appetite had been stronger than those of most women but in three cases certainly there had developed either a marked apathy towards or a strong distaste for the husband who had proved too dull or unimaginative or uninterested to hold their affections Along with this the children of the marriage became a great trial

When the patients were first seen at an out patient clinic the acute symptoms had in each case remained unchanged for at least two months but the total period of development of the illness had generally been much longer All the four failed to respond to weekly out patient psychotherapy and were admitted to mental hospital as voluntary patients

They appeared quiet and depressed with a tremendous apathy which so impaired their energy concentration and initiative that their household duties had become intolerable But on examination they quickly became emotional and spoke freely of their difficulties and of the utter hopelessness of their future The general intellectual level was good and the ordinary faculties well preserved Insight was complete and they were entirely without delusions or hallucinations There was no retardation They were friendly helpful and co operative and could laugh and be amused Insomnia was prominent Self pity was exaggerated and two of them said they had toyed with the idea of suicide but this was not considered to be a great danger at that time

Three of them complained of chronic bronchitis Signs of autonomic instability (flush pallor coldness and numbness of extremities dilated or variable pupils sweating frequency and urgency without apparent physical cause) were rather more noticeable than usual and the tendon reflexes were exaggerated But otherwise physical examination and laboratory investigation revealed no abnormalities

One patient was treated by prolonged narcosis the others by rest in bed mild sedatives and simple encouragement and interest They all appeared to improve a little but they were anxious to leave and discharged themselves Within a few days of leaving (in two cases within twenty four hours) they had committed suicide

We regard these patients as women of the obsessional type with very rigid ideas of right and wrong. It seems that dissatisfaction was followed by antipathy towards the husband complicated in one instance by a violent attraction to another man Inflexible moral standards learnt in childhood retained their full force and the patients were unable to deal with the conflict aroused

DISCUSSION

This group of cases is described as a contribution to the study of the prognosis in depressive states The difficulties of treatment in such cases and the danger of failure are apparent but there is a further complication of the problem

Such cases represent only one group of many different kinds of non certifiable mental illness which are coming in increasing numbers to psychiatric out-patient clinics The last resort in treatment for them can only be the mental hospitals where the facilities are often grossly inadequate overcrowding is almost the rule, and proper segregation of patients is sometimes impossible If this is a serious difficulty in the treatment of psychoses it may be tragic when the voluntary decision to seek help in a mental hospital is made with such mental stress and effort as can only be compensated for by complete cure and is accompanied by apprehension which proves to be justified

Reviews

VIRUS AND VIRUS DISEASES

Virus und Viruskrankheiten bei Menschen Tieren und Pflanzen By Dr Med Gustav Seiffert Wissenschaftliche Forschungsberichte Naturwissenschaftliche Reihe Volume 46 (Pp 221, 7 figures RM 16, bound, RM 17) Dresden and Leipzig Theodor Steinkopff 1938

To the growing number of books devoted entirely to the subject of viruses has now been added yet another, *Virus und Viruskrankheiten* by Dr Gustav Seiffert This book is divided into three main parts general, special, and technical The general section opens with a brief historical introduction and a definition of the term "virus" in its modern usage, and following this the author considers the various characteristics of viruses, such as size, filterability, morphology, chemical composition, and cultural requirements The bearing of this knowledge on the nature of viruses is discussed The last three chapters of this general part of the book are concerned with the question of immunity to virus infections and the epidemiology and specific prophylaxis of virus diseases

In the second or special part of the book, which is the largest of the three, the different viruses are described in detail, and although the author envisages here all viruses, including those causing disease in plants and insects, it is only the animal viruses which receive adequate treatment Included in this section are diseases of doubtful virus aetiology, such as acute rheumatism and post-vaccinal encephalitis, and diseases like whooping-cough and scarlet fever, which a few still consider to have a virus as their prime cause Perhaps it would have been better had a subsection been made for these doubtful viruses Throughout, however, this section is accurate and up to date and the presentation adequately critical where necessary Following the special section are two short ones devoted to the virus-like micro organisms (bovine pleuro-pneumonia and agalactia, rickettsia, bartonella, and grahamella) and the filterable forms of bacteria The author expresses doubt as to the existence of the latter, and a conviction, with which practically all virus workers will agree, that viruses are certainly not filterable forms of bacteria

The technical section with which this book closes is a short one It contains much useful information, but under staining methods one would have liked to see Castaneda's method included, and the three lines on complement fixation are surely inadequate Though, of course, it is true that this reaction as applied to viruses is, in principle, the same as in the case of bacteria, the beginner would find himself somewhat at sea if he were not told of the necessity for an adequate concentration of the antigen and the advantage of prolonged fixation

DISEASES OF INFANCY

Säuglingskrankheiten By Professor Dr H Finkelstein Fourth thoroughly revised, edition (Pp 899, 204 figures, including some in colour No price given) Amsterdam Elsevier, N V 1938

The fourth edition of Professor H Finkelstein's well-known work on diseases of infants has been completely revised and now appears under the auspices of a publishing firm in Amsterdam Some fourteen years have passed since the third edition, and in his revision not only has Professor Finkelstein introduced comments upon advances achieved during that period but he sums up as it were for the last time his long experience in paediatrics, especially as the subject concerns the period immediately after birth and the first year of life It is a tribute to his great reputation that his name appears upon the title page without any indication of any of his appointments, although the preface is labelled as from Berlin, where the last years of his active professional life were spent The present edition is beautifully produced with numerous illustrations, many in colour, and there is an excellent index

To the English reader the criticism must occur that in the many references to the literature there is only scant notice given to those advances made in the English speaking countries Dr Helen Mackay's work on anaemia is quoted and a certain amount of American literature is mentioned, but otherwise the conclusion must be reached that either our country has contributed nothing of importance in the last ten years or so to the study of the newborn or that what has been written is not considered of importance The work of the Edinburgh school, for example, in regard to various disorders of the newborn would appear worthy of mention, such as has been reported by Craig in the *Archives of Disease in Childhood* during the past few years, and the use of hypertonic rectal saline for the cerebral conditions of the newborn baby is another advance which has been widely accepted in this country and America but not apparently in Germany However, Professor Finkelstein has set out his own most valuable views, and all interested in the early months of life must be grateful for this present record of his great work and that of his many distinguished pupils on this subject

INJURIES TO ATHLETES

Athletic Injuries Prevention Diagnosis and Treatment By Augustus Thorndike, jun, M D (Pp 208, 104 figures. 14s net) London Henry Kimpton 1938

The author is a surgeon in the Department of Hygiene of Harvard University and therefore comes into intimate contact with injuries sustained by freshmen and sophomores in their various sports, particularly American football He gives an interesting quotation from the *Handbook of Harvard Athletics*, 1852–1922, which shows what an exaggerated position football had secured for itself in the University life It is worth quoting in full

"On the score of physical preparation the methods were equally absurd It was no uncommon thing for players to report at two o'clock in the afternoon and continue to play until it was actually dark Practice in those days consisted of hard scrimmage with hardly a minute for breathing space from beginning to end This was the routine from Monday to Friday unless there was a mid-week game to break the monotony There was also a spring and summer practice in addition to the entire fall preliminary season and only the severely injured were excused from daily work It is no wonder that men were burnt out physically and mentally long before the season closed

Dr Thorndike gives a detailed picture of the development of the 'medical room" in connexion with games in the university In 1927 a dietitian 'was put in absolute charge of all training tables in Cambridge and in New London" She appears to have been so effective that

at the end of the year it was noted that there had not been a single case of gastro intestinal upset during the football season while in previous years there had been as many as thirty eight men at a time unable to participate in athletics because of this condition Among other interesting points discovered by the dietetian was that a man taking part in

football or crew required almost twice the number of calories daily that he did while taking part in basketball track or hockey

Dr Thorndike has so cut down his chapter on the physiological basis of physical fitness that it is often difficult to follow his argument His interesting chart on page 31 of physical fitness as measured by lactic acid increase and carbonic acid capacity decrease requires fuller elucidation to make it really convincing His chapters on physical training and physical fatigue deal simply with the more important basic principles such as diet sleep graduated muscular effort and absence of drugs These chapters have many references to work carried out on the physiology of exercise and fatigue One particularly good feature of these references eighty eight in all is that they are not confined to American authors but cover Scandinavian and English authors especially A V Hill's pioneer contributions to the subject

The author states specifically that special exercises devised by Rayerott and Croker increase the strength of joint ligaments if done before strenuous games but he leaves the whole of this important matter without convincing proof as to why he supports their work The diagrams of joint injuries and the tearing of ligaments as well as the tables that accompany them suggest that the author is able to diagnose by digital examination exactly which ligament is injured and the extent of damage—a big claim The book has a number of statistical tables of his experience since 1932 in relation to various injuries and though these are interesting as the experience at one university they have little value for practitioners in England who really want to know the methods of diagnosis and treatment and the disability period of the injuries encountered in America not the mere numbers

Part III has been composed primarily for use as a book of reference It is not designed to be read through consecutively In this section the illustrations of strapping are clear and good and it is obvious that the author puts great reliance on this as a means of early return to the sport which has occasioned the injury The short chapter on physiotherapy in injuries does not enter into any detail recommending only Grayer and Ostrom's textbooks Massage preferably by a graduate of some recognized school of massage and of sufficient experience so that he will not aggravate and traumatize acute and recent injuries is recommended As a book of personal experience with interesting statistical tables and a careful bibliography this is a contribution to the subject of athletic injuries

ENCYCLOPAEDIA BRITANNICA YEARBOOK

Encyclopaedia Britannica Book of the Year 1938 Edited by M D Law (Pp 742 45s) Encyclopaedia Britannica Co Ltd London

It was an ambitious undertaking of the publishers of the *Encyclopaedia Britannica* to produce a book of the year which is described as a survey of the principal persons events and developments in various spheres of knowledge and affairs during the year 1937 Including the index to the volume there are 742 pages, and this presumably is a measure of the rate at which developments occur in these expansive modern times But if a book of such formidable dimensions is to be produced each year then the systematic purchaser will have to look to his shelf-room It would seem as though the editor has tried to combine an account of what happened in 1937 and of the events that have taken place since the last edition of the *Encyclopaedia Britannica* She has combined a yearbook with a supplementary volume As there was a gap in time to be filled it might perhaps have been better to produce a supplementary volume and so to entitle it

The reader who buys the yearbook as a supplementary volume will be well rewarded for all the features that have gone to make the *Encyclopaedia Britannica* a household word in the world of learning are here happily preserved Accuracy thoroughness scholarship are combined with modernity and the editor has been nobly supported by the usual first class team of contributors Medicine is well served and we are pleased to notice names familiar to readers of this *Journal* Sir Henry Brackenbury on hospitals Sir Robert Johnstone on gynaecology and obstetrics Professor R M F Picken on epidemiology and infectious diseases Dr C W Buckley on rheumatism Dr J Blomfield on anaesthetics Professor L P Garrod on immunization Sir Robert McCarrison on nutrition and vitamins—to mention a few There are a number of American contributors to the volume and in places the editor has evidently had difficulty in co ordinating the material supplied to her from the U S A with what was ready to hand Britannica has undergone an extension of meaning but not necessarily without profit though with some lack of cohesion between its geographical elements At the beginning of the volume there is a diary of events the first of which (January 1 1937) is headed Spanish Civil War and the last of which (December 31 1937) refers to Sir Robert Vansittart's appointment to the post that was newly created for him

IRIS PATTERN AND ITS GROUPINGS

Structural Variations of the Human Iris and their Heredity With Special Reference to the Frontal Boundary Layer By Viggo Eskelund M D (Pp 244 16 figures 28 plates 9 tables 21s net) Copenhagen Arnold Busch London H K Lewis and Co 1938

Here we have an account of a very thorough investigation carried out at the University of Copenhagen under the auspices of the P Carl Petersen Foundation it is published in English with a summary in four languages Dr Eskelund's material for study was microphotographs of the living iris in 134 persons his purpose was to frame a method of classification of iris pattern in man and to work out the inheritance of the several types mainly with a view to assessing their value as evidence of paternity His thesis is that certain distinctive features can be recognized in the iris of every human eye—number of contraction furrows amount of atrophy of anterior layer position of lesser circle amount and distribution of mesodermal pigment—and from them a formula constructed which will give at a glance the type of iris His terminology makes it rather difficult for English readers to follow the exposition and argument, and the use of a higher magnification when examining the eye might have helped to clarify the description

Painstaking as Dr Eskelund's work has been in this limited field the impression remains that detailed study of a much larger number of individuals including people of many different races should be undertaken before it is safe to generalize on the heredity of iris pattern While no two persons show an identical pattern a broad classification into types is possible—as in the case of finger-prints How far such characters are genetically valid remains to be shown but Dr Eskelund has laid the foundation for a classification of iris pattern based on minute structural differences and this should prove more precise than the older groupings that depend on colour and macroscopic appearance

SIMPLE INSTRUCTION ON SEX

Sex in Everyday Life By Edward F Griffith M R C S, L R C P With an Introduction by Sir Walter Langdon-Brown and a Foreword by the Rev A Herbert Gray, D D (Pp 379 10s 6d net) London George Allen and Unwin 1938

Nowadays there is an insistent demand for improvement in sex instruction both for the adolescent and for those about to marry, and many books have been written advocating various methods of imparting this Dr Griffith has written one more of these books and it is better than most The first part of the book is concerned with the anatomy and physiology of sex and the general subject of family limitation A historical survey of methods in vogue through the ages is followed by chapters on modern views on scientific contraception and the medical indications for the prevention of pregnancy The second part is concerned with the question of happy marriage and the relationship of good physical adjustment with the spiritual and emotional satisfaction of the individuals concerned The very real difficulties are frankly faced and solutions suggested, and the objects and methods of sex education at the various age periods are dealt with The third part consists of a series of appendices elaborating with statistical and other information various points raised in the main part of the book

The subject is clearly dealt with in non-technical language and in a sober and unemotional strain, and this book should be of great value to the physician, the teacher, and parent, and to the intelligent youngster himself It is an eloquent plea for the use of properly controlled and planned contraception on the grounds of eugenics, morality, and the greater happiness of the community

Notes on Books

The book of Andreas Laurentius on the *Preservation of the Sight, of Melancholike Diseases of Rheumes and of Old Age* has rather fallen into the background of late years, for he is now thought of more as an anatomist than as an oculist Mr SANFORD V LARKEY therefore, has done him a service by issuing in facsimile the English translation published in 1599 by Richard Surphlet, who was himself a coucher of cataracts The book was well known to Richard Burton, who quotes him some sixty times in the *Anatomy of Melancholy*, printed twenty years later Mr Larkey writes an interesting introduction telling all that is known about Andre du Laurens and Surphlet, and explaining why rheums and old age were dealt with in addition to eye troubles The book is issued as No 15 of the Shakespeare Association facsimiles, and published by Humphrey Milford at 21s

Lord HORDER'S admirable essays entitled *Health and a Day*, which we reviewed on September 18, 1937 (p 590), have now been reprinted as the second volume in the Aldine Library (J M Dent and Sons, 4s 6d) The substance of the book is unchanged, not, as Lord Horder points out in an introduction, because he has said the last word on any of the subjects, but because the essays express a philosophy which has guided his judgment over a long period

The Medico-Legal Society of Victoria has issued a volume of its *Proceedings* during the years 1933–6 This is the second volume published since the society was founded in 1931, and has been edited by Mr JOHN V BARRY barrister-at-law, and Dr A E COATES The addresses contained in it show the variety of subjects which members have discussed and the thoroughness with which they have been studied Among a first class collection of essays there stand out that on science and judicial proceedings, by the Hon Owen Dixon, a Justice of the High Court of Australia, the lawyer in science, by Professor W H Osborne, and some aspects of magic, witchcraft, and sorcery, by Mr Barry The *Proceedings* are a fine contribution to the study of medico legal science The society intends for the future to publish a volume every two years, and the next will contain addresses given during 1937 and 1938, with discussions

Preparations and Appliances

COMBINED BLOOD TRANSFUSION SYRINGES AND NEEDLES

Dr H C LUCEY, Pathologist to the Metropolitan Hospital, London, E, writes

As an alternative to French's or other wide bore needle, which, attached direct to rubber tubing, is used for withdrawing blood from a donor, the combined blood donor's syringe and needle (Fig 1) offers certain advantages

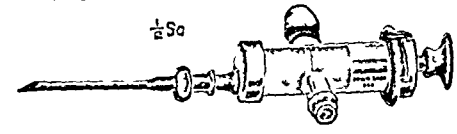

FIG 1

This small glass syringe has a metal eccentric nozzle with a hypodermic cone The bore of the nozzle is the same as the terminal opening of French's needle, 1·8 mm in diameter There is no bend of the lumen at its junction with the barrel of the syringe, so that a wire for cleaning can be passed straight through it The 14 standard wire gauge stainless steel needle, to fit, has the same size bore as the nozzle of the syringe and a tube length of 1¼ inches Projecting from the barrel of the syringe are two side branches According to which arm of the donor is selected for venepuncture, so one or other side branch is used To this is fixed a length of rubber tubing for conveying the blood to a flask containing citrate solution The side branch directed away from the donor's body is obviously the one chosen the other is closed with a sterile rubber cap The metal piston can be withdrawn only far enough to open the side branch for the free flow of blood By this means 800 c cm of blood can be taken without fear of clotting, provided a satisfactory rate of flow is maintained

For transfusing citrated blood to the recipient a useful syringe to interpose between needle and tubing is shown in Fig 2 Originally designed for saline transfusion, it should,

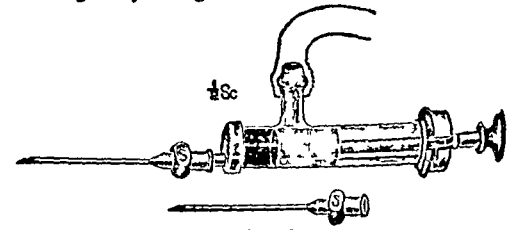

FIG 2

when employed for giving citrated blood, be provided with a straight throughway from barrel to nozzle The most serviceable needle is 18 s w g with a tube length of 1¼ to 1½ inches For children a smaller needle, 20 s w g, may be necessary

The advantages of interposing a syringe between needle and tubing, both when taking and giving blood, are (1) It acts as a handle for manipulating the needle This and the eccentrically placed nozzle facilitate venepuncture (2) It makes it easy to tell, by a slight withdrawal of the piston if the vein has been entered (3) Spilling of any blood is avoided (4) The piston by opening or shutting off the flow of blood renders a clamp unnecessary

Both syringes and needles are supplied by Down Bros, 21, St Thomas's Street, London, S E 1

Nova et Vetera

THOMAS JOHN MACLAGAN, 1838 1903

Amidst a continuous deluge of centenaries the names of men who have helped to relieve the burden of mankind's pain will always find an echo in its heart It is as a humanitarian of the medical profession that Thomas John Maclagan is gratefully remembered in the centenary year of his birth After taking the M D at Edinburgh in 1869 and studying in Paris Munich and Vienna Maclagan practised in Dundee until 1879 when he moved to London Here he rapidly acquired a large and fashionable practice numbering among his patients his countryman Thomas Carlyle He was also physician in ordinary to the Prince and Princess Christian of Schleswig Holstein Though he lacked the necessary facilities for research through not being on the staff of one of the larger teaching hospitals his keen critical mind and his accurate powers of observation served him well in the investigations which he undertook in private practice

Salicin for Rheumatic Fever

As the result of two years study appeared his paper The Treatment of Acute Rheumatism by Salicin (*Lancet* 1876 1 342 383) which at once attracted professional attention revolutionized the treatment of the disease and is to day one of the classics in medical literature It was later expanded and published in book form under the title *Rheumatism Its Nature Its Pathology and Its Successful Treatment* (London and New York 1886 second London edition, 1896) Rejecting the neurotic and the lactic acid theories of rheumatism the author suggests in their place the miasmatic theory according to which the rheumatic poison enters the system from without rheumatism is due to the life process of a parasite having its special nidus in muscles and in the fibrous tissues of the joints and the heart. Noting the analogy between rheumatic fever and malaria Maclagan is impressed by the fact that cinchona trees grow most readily in malarial districts and arguing that Nature would similarly provide a remedy for rheumatism in regions which favour its occurrence he turned his attention to the willow employing salicin with success particularly in the acute and subacute forms of the disease. To give the drug in routine fashion of ten grains three times a day or four hourly he taught was to bring it into disrepute and to court failure He insisted on giving large doses of twenty or thirty grains every hour for six doses on two succeeding days until pain subsided and temperature became normal

Before the publication of his paper salicin was kept by chemists merely as a curiosity which was sold at two shillings an ounce. The price speedily rose to as high as twelve shillings and at one time as the demand exceeded the supply the drug ceased to be quoted in the druggists monthly lists Before the introduction of salicylates rheumatic fever with its agonizing pain restless nights and drenching sweats was the despair of physicians In the therapeutic armamentarium of modern medicine the salicylates have taken their place as efficient analgesics and antipyretics, Their specific action on the rheumatic poison is now doubted and the belief that they can prevent heart disease and shorten the course of the illness is slowly dying out

A kindly honest unselfish character Maclagan was exuberantly self reliant A keen sportsman he yearly spent his autumn holiday on the moors of Scotland He died at the age of 65 after a gastro enterostomy for cancer of the stomach It scarcely detracts from his fame to mention that a decoction of willow tops had long before him been a popular remedy for rheumatic fever among the Boers and Hottentots

W R B

THE FOUNDER OF THE SURGEON GENERAL'S LIBRARY

The April number of the *Bulletin of the Johns Hopkins Hospital* contains a series of papers to commemorate the centenary of the birth of John Shaw Billings who was characterized by Professor Welch as the "wisest man I ever met" Billings was known to the medical profession throughout the world as the virtual founder of the Surgeon General's Library at Washington and as the inventor of the Index Catalogue The outbreak of the Civil War found him a demonstrator of anatomy at the Ohio Medical College just beginning to think about entering a general practice He volunteered for medical service with the Confederate Army, passed first in the examination for a commission and was attached to the Potomac Army Here he saw service at the battles of Chancellorsville and Gettysburg in 1863 and wrote lively accounts of them to his wife He was then sent to New York with the troops employed in quelling the riots which had broken out in the city and having proved his worth was relieved of duty in the field and was assigned to the Washington branch of the Medical Director Soon afterwards he went to the Surgeon General's Office in the War Department Here he was employed in the problems of military sanitation and did much to improve the conditions under which the Army lived in the barracks and hospitals He acted for a time as Curator of the Army Medical Museum but always a lover of books he found his real *metier* in building up and cataloguing the Library of the Surgeon-General Of those early days I must be one of the last English survivors who actually saw him at work on the Index Catalogue He spent a week end with us when the Sydenham Society was publishing Mayne's *Lexicon of Medical Terms* His first request of my mother was that he might have a washing basket and a large pair of scissors put in the drawing room She consented and during the whole evening he occupied himself in cutting out articles from a trunkful of journals which he had brought with him talking all the time and saying that he would sort them out on the voyage home

J S Billings in Other Roles

The Library did not exhaust his energies He did much to improve the standard of medical education in the United States and took an active part in the building of the Johns Hopkins Hospital where he served as professor of hygiene and of the history of medicine He outlined the scheme of study for the medical students and was in advance of his time when he recommended that comparative medicine should be taught Being thus experienced in building and in libraries his services were wisely utilized when it was decided that the Astor and Lenox libraries should be consolidated as the New York Public Library The amalgamation was carried out and Billings was appointed director early in 1896

Billings led a full useful and happy life It was said of him that he was one whose judgment you sought on any difficult subject, and you pinned your faith to him *more than to any man of your acquaintance* He was wise because he was under no illusions He got at the heart and essence of things He was eminently a sane man who knew what it was best to do under the circumstances and what it was practicable to do This quality was associated with wide vision and high ideals

The various contributions are illustrated with a series of well reproduced photographs showing Billings from youth to age The papers are written by Lieutenant-Colonel E. E Hume Dr Alan M Chesney Mr Sanford V Larkey and Mr H M Lydenberg

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY AUGUST 27 1938

NATIONAL INSURANCE IN NEW ZEALAND

The position with regard to national health insurance is not the same in New Zealand as in Australia, but it is at least equally important and urgent The Government of the Dominion has now introduced in the House of Representatives a Social Security Bill which embodies its proposals both for superannuation allowances and pensions and for health insurance Considerably more than a year ago the Government announced that it had a "plan" for these purposes, that its Bill would be immediately introduced into Parliament, and that the scheme would become operative on April 1, 1938 Whatever may have been the case with reference to superannuation, inquiry soon showed, however, that no such plan relating to national health insurance was in existence, that what was in the mind of the Government should more properly have been described as an "idea", but that, nevertheless, the project of precipitate action was still adhered to and proclaimed Governmental study of the actuarial and the medical aspects of what was evidently intended to be a far-reaching and complicated scheme of a kind of which the proposers had little knowledge and no experience had been quite perfunctory, and its effects upon existing medical practice and upon non-Government hospitals had not been taken into account So far as any information could be extracted from members of the New Zealand Government it became evident that its suggestions were to be based upon ideological principles rather than on practical requirements, and a little later, when the reports of not very authoritative committees on the subject came forward, it was found that their major recommendations suffered from the same fundamental defect, even though many suggested details sensibly following those of the English system In these circumstances the efforts of the New Zealand Branch of the British Medical Association were mainly directed towards securing a postponement of action in order to afford what it was hoped would be adequate opportunity for further inquiry and consultation as to the extent of any such scheme needed to meet the requirements of the Dominion, and as to its effect upon medical practice and hospital interests

In their immediate object these efforts were successful Mr Fraser, the Minister of Health, was not unsympathetic and became convinced that there was room for further inquiries, and that representatives of a number of affected interests ought to have an opportunity of securing consideration of their opinions and suggestions To a limited extent such opportunities have been afforded, but they have not been as full or prolonged as was really necessary, since it became clear that, whatever might be the evidence produced, the Government as a whole was not going to be moved from its fanciful project for a health insurance scheme that should include the whole population of the Dominion As the basis of discussion with the New Zealand Branch of the Association the Government had accepted the memorandum presented to it by the Branch, which was published as an addendum to the report by Sir Henry Brackenbury of his visit to New Zealand in our *Supplement* of February 12, 1938 (p 85) In this memorandum the Branch made it clear that, though it was not convinced that the ground had been sufficiently prepared, it was willing to accept and to co operate in a system which offered a complete medical service to those members of the community who were not in a position to secure it for themselves This was an offer of very great value and importance, far removed from any selfish or obstructive motives Instead, the Government has preferred—apparently from an erroneous belief that this is necessitated by some abstract socialistic ideal or principle—to present to Parliament a scheme for an incomplete medical service for the whole population whether they can provide it for themselves or no The medical profession of the Dominion in its negotiations has secured for the hospitals which are under private or church management a less unfavourable position than had been originally proposed, and no doubt all, or nearly all, the differences on less important matters mentioned in the memorandum could, with further discussion and good will, have been satisfactorily adjusted, but on this major proposal of a universal clientele for the scheme there was an irreconcilable divergence, and the Branch was driven to tell the Government that further discussions were useless No doubt certain members of the Government had made up their minds to create this situation from the beginning

This is really a proposal to socialize the medical profession in advance of the rest of the community No doubt if in a democratic country the people had definitely and deliberately determined to establish a completely socialistic state of society the medical profession would have to submit to this along with all other professions trades and occupations No doubt also the particular form of socialization proposed—through universal compulsory contributory insurance—is less objectionable than other methods that can be conceived The people of New Zealand have however, not so decided, and there seems no reason why the medical profession alone should be chosen for this experiment The profession in New Zealand is convinced that such action is not needed by reason of the condition of the country that the proposed system would be unfair to the doctors and not nearly so conducive to the general health as the alternative they themselves suggest The profession is at least as anxious as any other section of the community to promote public health and welfare and its experience in this matter makes its opinion even more valuable than that of any other section Though the cost of the proposals is not specifically a medical matter, medical practitioners cannot be indifferent to it The estimated cost of the whole measure, including pensions, is for the first year £15 000 000 gradually rising in later years to £25 000 000, this to be borne by a population totalling less than a million and a half Mr Nash the Minister of Finance, says that this can easily be met, but the truth of his statement is not obvious No doubt Parliament will pass the Bill if the Government persists There will however, be a General Election before the date at which the Act comes into operation, and there may be opportunity for modification In any event the attitude of the New Zealand Branch of the Association is clear and determined A poll has been taken and more than 95 per cent of the members have declared themselves in opposition to the scheme Such help as is required from the central office of the Association will be willingly forthcoming It will be remembered that the Central Council has accepted the report of Sir Henry Brackenbury already referred to In it he forecast the development of the present situation and recommended that in that contingency the fullest possible support financial and other should be given to the profession in New Zealand With such support and if the profession in the Dominions maintains its united front it is not unreasonable to expect a successful issue *Perhaps it is not even now too late* for the Government of New Zealand to take some action to avoid what would be a very unfortunate and undesirable struggle

THE NEW U S A FOOD AND DRUG ACT

The Federal Food Drug and Cosmetic Act was approved by the President of the United States on June 25 and after a year's interval will replace the Food and Drugs Act of 1906 An outstanding provision of the new measure is one which declares it an offence to make false claims of curative effects on the labels of patent medicines irrespective of whether the claims are made with fraudulent intent This is an important advance because previous legislation had checked the advertising of false claims in the U S A but had not interfered with statements made on the labels, and full advantage was taken of this loophole No one can foretell how laws will work in practice but the general intention of the 1938 Act is to make it a dangerous business to promote the sale to the public of medicines by means of false claims of curative properties This legislation may have repercussions in our country, because many American "patent' medicine vendors will presumably have to look for new markets for their wares and Great Britain is the only large English speaking community in which the law does nothing to protect the public against fraud in this field

The new Act covers a very wide ground and its scope is explained in a recent editorial in the *Journal of the American Medical Association*[1] One valuable provision is that no new drug may be sold to the public unless its safety is generally recognized by experts The object here is to prevent any repetition of such tragedies as the wholesale poisoning lately caused by the sale of sulphanilamide dissolved in diethylene glycol Restrictions of this nature are an obvious necessity There is practically no limit to the number of new compounds which the organic chemist can make and the pharmacological actions of only a tithe of those produced are known It is ridiculous to allow the testing of the safety of a new compound by means of its distribution to the public The new Act requires any drug that is not designated by a pharmacopoeial name to be labelled to show its common or usual name This provision applies also to preparations containing several active ingredients It thus abolishes secret remedies and furthermore will check a form of semi secrecy that is becoming more and more popular—namely the sale of a medicine under a fancy proprietary name accompanied by a 'disclosure of its nature by a statement of its chemical formula in some unfamiliar form The Act also prescribes special warnings of the presence in medicines of various powerful or habit forming drugs The sale of most of the drugs mentioned is restricted in this

[1] July 23 1938 p 324

country by means of the Poisons Acts or the Dangerous Drugs Acts, but the U S A Act includes bromides in this list, which is an important safeguard to the public The sale of foods represented as having value for special dietary purposes is increasing very rapidly, and the new Act enables the Government to require the labels on these preparations to give such information concerning their vitamin, mineral, and other dietary properties as is deemed necessary to inform the purchasers fully regarding their value The control of cosmetics instituted by the Act is a new departure, and the regulations are somewhat tentative One noteworthy provision is that which forbids the inclusion of ingredients when it can be shown that they may render the cosmetic injurious to the users This should suffice to check the sale of face creams containing sex hormones, a practice for which a demand has been created in the United States

The points mentioned above suffice to show that the new legislation represents a serious effort to protect the public of the United States from fraud in relation to the sale of medicines, and also against accidental poisoning due to rash experiments with compounds whose properties are unknown The *Journal of the American Medical Association* points out that the effectiveness of the new law depends upon the manner in which it is administered, and this in turn depends on whether Congress allots enough money to provide adequate staff and machinery As regards this country, we are forced to admit that the previous legislative control in America has been in advance of our own, and the new Act will make the difference still more striking and discreditable to our rulers

VITAMIN C IN MILK

Cows' milk is far from being an abundant source of ascorbic acid (vitamin C) nevertheless it is desirable to retain as much as possible of this labile substance The work of Kon and his colleagues at Reading has shown that in the cow's udder ascorbic acid is present in the reduced condition, but that as the result of subsequent exposure of the milk to light it is oxidized and later rendered biologically inactive Exposure of a bottle of milk to sunlight on the doorstep of a house for half an hour may lower its ascorbic acid content by 50 per cent Heating as in pasteurization, accelerates the inactivation of the oxidized form, but has apparently no effect on the reduced form In other words milk that is protected from light can be pasteurized without destruction of the ascorbic acid Since both ascorbic acid and oxygen are colourless it is a little difficult to understand why the short waves of visible light which are known to be active in the photochemical oxidation of ascorbic acid, are absorbed by these substances Recent observations by Hand, Guthrie, and Sharp[1] in the United States of America suggest that lactoflavin (vitamin B_2), which absorbs blue light plays a considerable part in this reaction If lactoflavin is removed from the milk by adsorption ascorbic acid is no longer oxidized by exposure to light Prolonged exposure of milk to sunlight destroys both lactoflavin and ascorbic acid If fresh ascorbic acid is now added no further destruction occurs in the presence of light, but if lactoflavin is added as well ascorbic acid is rapidly oxidized In mares' milk, which contains little or no lactoflavin, ascorbic acid is relatively more stable than in cows' milk It thus appears that for the photochemical oxidation of ascorbic acid both dissolved oxygen and lactoflavin are required If the vitamin C content of milk is to be preserved it is obviously important to protect the milk from light as far as possible This is not always easy, particularly when the milk has to be distributed on the rounds in bottles The American workers show that very satisfactory results can be obtained by freeing the milk from dissolved oxygen The milk is subjected to an evacuation process in which the oxygen is swept out by the water vapour The method can be applied before or after pasteurization Provided the milk is cooled and bottled in such a way as to prevent access of oxygen it can withstand exposure to light without suffering any decrease in its content of ascorbic acid Pasteurized milk treated in this way was found to contain 20 mg of ascorbic acid per litre after being kept at 1° to 3° C for seven days, while untreated raw milk had its initial content of 20 mg per litre reduced in this time to 2 mg The evacuation process is also of value in removing off-flavours due to oxidation changes in the fat Whether this method will prove suitable for adoption on a commercial scale is not discussed, but from an academic point of view the results are of undoubted interest

SUICIDE BY TUBERCLE BACILLI

We are rarely given the opportunity to record observations in man in which the conditions are comparable to those in experimental animals A case reported by A Lemierre and P Ameuille[2] is noteworthy not only for the circumstances leading to the illness of the patient but also for the light which the clinical and pathological observations throw upon certain points in the aetiology of tuberculosis A medical man aged 29 with a "history of tuberculosis in the family" who had probably suffered from pulmonary tuberculosis himself a few years earlier and who at all events had shown a positive Pirquet test a short time before the onset of his illness, gave himself in an attempt at suicide, an intravenous injection of virulent tubercle bacilli Two days later a pyrexia began which persisted until his death three months from then A radiograph nine days after the inoculation showed normal lung fields but in one taken thirty two days after the inoculation the typical appearance of miliary tuberculosis was seen, twelve days before death there was confluence of these shadows Enlargement of the spleen was observed within the first few days of

[1] *Science* 1938 87 439
[2] *Bull Mem Soc med Hop Paris* 1938 54, 286

the illness but there were no cough sputum or dyspnoea and no physical signs in the lungs until shortly before the man died—from meningitis Repeated examination of the blood showed at first a relative mononucleosis with only 53 per cent neutrophils and then a gradual increase of the latter to 90 per cent eosinophils were absent throughout It is of great interest that ten days after the inoculation no tubercle bacilli were isolated from the blood by Loewenstein's technique or by animal inoculation showing that the organisms had already by that time established themselves in the tissues Though it is almost certain that bacilli reached other organs in the body clinically lesions were found only in the lungs and meninges Finally the case appears to show conclusively that in certain circumstances at all events exogenous reinfection may overcome immunity acquired by previous tuberculous infection

METHYL CELLOSOLVE AS AN INDUSTRIAL POISON

Much has been written on the toxicological properties of ethylene glycol and the solvents derived from it The use of ethylene glycol as a substitute for glycerol in certain foodstuffs has been opposed on the grounds of its oxidation in the body to oxalic acid Diethylene glycol has recently led to fatalities from its use as a medium for certain medicinal agents Some interesting and important reports[1] have now appeared on the toxic properties of the valuable cellulose acetate solvent methyl cellosolve (ethylene glycol mono methyl ether) for which no toxic effects on man have hitherto been recorded Not the least instructive features in these reports are the description of the detailed way in which the investigation of the affected workers was carried out and the clear cut demonstration of the nature of the symptoms The workers were employed in a shirt factory where solvents were used for stiffening the collars of the shirts The collars were dipped in a solution consisting of methyl cellosolve and ethyl alcohol denatured with methyl alcohol ethyl acetate and petroleum naphtha After dipping the collars were dried and pressed The workers wore rubber gloves during these operations The clinical picture of the poisoning is summarized thus (1) Severe smarting burning and watering of the eyes with conjunctival irritation (2) Toxic encephalopathy indicated by personality change frequent dizzy and faint spells sleepiness loss of interest in normal amusements and activities general hypertonicity exaggeration of all reflexes dilatation of pupils ankle clonus moderate ataxia and positive Romberg sign (3) Anaemia of moderate severity associated with granulopenia and a marked increase in the proportion of immature neutrophils the anaemia was of the macrocytic type with a high colour index (4) Additional symptoms were gastro intestinal disturbance vomiting ketosis nocturia In two cases with marked symptoms removal from exposure to the solvent combined with appropriate treatment for the anaemia led to complete clinical recovery As a result of these findings on two cases the New York State Department of Labour (Division of Industrial Hygiene) undertook a comprehensive study of employees in a shirt factory where methyl cellosolve was used in conjunction with denatured alcohol All the young men examined (nineteen) had abnormal blood pictures but clinically they fell into three groups negative clinical picture abnormal neurological physical signs but no symptoms abnormal neurological physical signs and symptoms of fatigue and drowsiness The outstanding abnormality of the blood was the high proportion of immature neutrophil granulocytes in every case There was also noticeable lowering of the platelet count. The blood picture was summarized as that of a macrocytic anaemia There was also evidence of individual susceptibility It is cautiously suggested by the authors that methyl cellosolve was the responsible agent and that it is desirable to keep the concentrations of this substance in the air below 25 parts per million Since then workers have been exposed to fumes of methyl alcohol and other denaturants and control observations made on workers exposed to acetone and methanol in a plant engaged in a process like the one previously considered but in which methyl cellosolve was not used The concentrations of methyl alcohol and acetone at the breathing levels of the workers were 25 p p m and 45 p p m respectively At the plant where the methyl cellosolve was used the concentrations in the air when the windows were wide open were methyl cellosolve 25 p p m ethyl alcohol 70 p p m methyl alcohol 5 p p m ethyl acetate 2 p p m petroleum naphtha 0 3 p p m All these concentrations were very greatly increased if the windows were closed Since the methyl cellosolve mixture was used in open trays and shallow pans increases in local temperature and deficient ventilation or on the pressing machines clogging of the exhaust apparatus must rapidly have raised the concentration of methyl cellosolve in the air The practical outcome of these observations is the clear indication to users of methyl cellosolve that stringent precautions must be applied to prevent absorption of the vapour

EXPERIMENTS ON ANIMALS IN 1937

The recently issued Home Office return[1] relating to experiments on living animals records an increase in the number of experiments performed The total figure for 1937 was 918 960 including 40 319 experiments carried out with anaesthetics and 878 641 experiments comprising inoculations hypodermic injections feeding experiments, and other proceedings performed without anaesthetics The return states that in no case was a certificate dispensing entirely with the use of anaesthetics allowed for any operation more severe than subcutaneous venesection Serious operations are always required to be performed under an anaesthetic A condition attached to all licences was that if an animal was found to be suffering from severe pain which was likely to endure it should be painlessly killed Except in certain experiments dealing with the efficiency of antiseptics the regulations demand the use of full antiseptic precautions in order that wounds may heal as painlessly as possible During the year thirty seven

[1] *Experiments on Living Animals* 1937 H M Stationery Office 1s

licensees performed 35,008 experiments in the course of cancer investigation, 3,290 of these were operations requiring anaesthetics, the remainder were almost entirely inoculations into mice or exposure of animals to radiations Three hundred and twenty-two licensees performed over 179,000 experiments for Government Departments and other public bodies In addition, more than 346,000 experiments were carried out in the course of the preparation and testing of antitoxic sera and vaccines and for the testing and standardizing of drugs The inspectors made 901 visits to registered places during the year, in most cases without previous notice, and witnessed a number of experiments Only seven cases of irregularity were reported, none of them serious, the offenders were admonished The advisory committee appointed to assist the Home Secretary with advice in the administration of the Act consisted of Lord Atkin (chairman), Dr H Morley Fletcher, Sir Farquhar Buzzard, Mr W Sampson Handley, Sir D'Arcy Power, Mr Wilfred Trotter, and Sir John Herbert Parsons

SENSITIVITY TO SUNLIGHT

This is the time of year when many patients have discovered for themselves the existence of erythema solare, for the occurrence of which the explanation is comparatively simple Those disorders of the skin associated with an abnormal degree of sensitivity to light, however, are not so easily explained The most familiar is the form known as "hydroa aestivale," in which blisters followed by scarring occur on the skin of those who suffer from a congenital abnormality of haemoglobin metabolism in which great excess of porphyrin appears in the urine J T Brugsch and L A Brunsting[1] in reporting on a study of porphyrin excretion in various skin disorders point out that haematoporphyrin, which was supposed to be excreted in the urine in the congenital or primary cases of this metabolic disorder, does not in fact exist in normal human metabolism and is a laboratory product of a special form of blood decomposition The most significant end-product of normal porphyrin metabolism appears to be coproporphyrin which is excreted in bile, urine, and faeces The largest excretion of porphyrin occurred in cases of exfoliative dermatitis, following a reaction of sensitivity to neoarsphenamine, and whenever there was evidence of severe derangement of the general metabolism Ordinary sensitivity to light does not appear to affect the excretion of porphyrin Another skin disorder produced by some inborn sensitivity to sunlight is xeroderma pigmentosum, and in reporting two brothers suffering from this malady A G Silberstein[2] records that there was absence of any evidence of abnormal excretion of coproporphyrin The special point of interest in these additional cases was the simultaneous occurrence of the effectualities of the speech and gait and marked milk that incidency It is suggested that there may be without dissociated degeneration of the nervous system ascorbic a to the degenerative lesions of the skin little difficult ey is seen in those cases of polyneuritis visible light, photochemical by these subs

associated with so called haematoporphyrinuria These cases of xeroderma and those of primary porphyrinuria already mentioned represent a congenital hypersensitivity to sunlight acquired forms due to certain toxic drugs are well recognized Sulphonal poisoning is perhaps the best known, and in recent times the risk of exposing to sunlight patients under intensive treatment with the sulphanilamide compounds has been recognized Light sensitization in animals following the ingestion of certain poisonous plants has been recorded by F P Mathews[3] in a fascinating study of lechuguilla poisoning Serious losses among goats and sheep and to a limited extent among cattle in the south western districts of the United States of America have long been traced to the eating of the leaves of the *Agave lechuguilla* a plant of Mexican origin and of the same genus as the decorative American aloe which occurs in Europe Experiment has shown that this plant produces a hypersensitivity to light less than six hours after its administration Erythema, pruritus, lacrimation, and oedematous swelling of the face and ears are some of the symptoms described Nervous disturbances were also observed in the experimental animals, they are of interest in view of the suggested nervous affection in porphyrinuria and in xeroderma pigmentosum The photodynamic agent in lechuguilla poisoning has not been identified, but it differs from the toxic saponin causing changes in the liver and kidneys and responsible for the animal mortality The stupid self-induction of erythema solare by devotees of the modern sun bathing cult may perhaps be paralleled by the suicidal tendencies of the Texas livestock!

THE EDUCATIONAL NUMBER, 1938

The *British Medical Journal* dated September 3, 1938, will be the annual Educational Number Its contents, as in previous years, will include a full account of the requirements of the General Medical Council and of the universities and other licensing bodies in Great Britain and Ireland, as well as information about the opportunities offered by the various medical schools and other teaching institutions and the fees charged by each The details given have been revised and brought up to date by the authorities concerned These sections, the object of which is to furnish a handy guide to intending students of medicine, are supplemented by articles for newly qualified practitioners on such matters as post graduation study (with special reference to the British Postgraduate School at Hammersmith), the public medical services at home and abroad, tropical medicine, psychological medicine, and the various special diplomas The opening article for our forthcoming Educational Number, written by Sir Walter Langdon Brown, is entitled "The Medical Curriculum and Present day Needs"

The Prime Minister, Mr Neville Chamberlain, will open the new King's College Medical School of the University of Durham at Newcastle on Tyne on October 8

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

DISLOCATIONS AND FRACTURES OF THUMB AND FINGERS

BY

DAVID TREVOR, M.S., F.R.C.S.

Every injury to the hand especially the fingers is very common on account of the widespread use of complicated machinery which has increased the number of fractures of the finger and thumb. If these injuries are treated inefficiently much permanent disability may result even with efficient modern treatment there is occasionally an incapacitating degree of disability. Hence the study of the treatment of fractures and dislocations of the hand digits has an important economic aspect—the reduction of the amount of resulting disability and prevention of excessive loss in wage earning capacity. A working knowledge of the method of production and the resultant deformity of any fracture or dislocation is essential for rational treatment and this aspect will be surveyed briefly.

Type of Anaesthesia

What type of anaesthesia should be used in dealing with finger fractures? A local anaesthetic such as 2 per cent novocain is suitable. It should be kept in a rubber capped bottle the cap being cleansed with ether immediately previous to withdrawing some of the solution the novocain must be sterilized immediately before use on each occasion. If local anaesthesia is employed the site of the fracture and surrounding parts must be cleansed with soap and water ether and then 2 per cent iodine solution. About 3 to 5 c.cm. of 2 per cent novocain is injected in the region of the fracture into the blood extravasation. Gentle kneading is then done and about five to ten minutes is allowed for the anaesthetic to take effect. Local anaesthesia is to be preferred if there is a shortage of assistance. It should not however be used for (1) any fracture which is more than about five days old (2) children or nervous women (3) open fractures.

In place of a local anaesthetic nitrous oxide can be employed. It is however much better to use gas and oxygen with a minimum of ether as with gas alone in the case of a fracture such as Bennett's it will be difficult to accomplish reduction and fixation before the patient is round.

Bennett's Fracture

Most of the movements of the thumb especially extension abduction and opposition occur at the saddle shaped carpo metacarpal joint any mechanical derangement of which will cause interference with the full function of the thumb. Bennett's fracture is a fracture dislocation of this joint the dislocation being of equal importance to the fracture. It is produced by indirect force applied to the thumb in an adducted position. The line of fracture runs obliquely so that a small fragment of bone with practically no displacement sustains the greater part of the articular surface of the base of the first metacarpal bone while the remaining portion of the metacarpal bone bears a small portion of the articular surface and is displaced outwards and upwards.

It should be stressed that it is most important to have an x ray examination in both antero posterior and lateral planes whenever there is the least suspicion of a fracture occasionally an oblique view is required in addition to exclude a fracture such as that of the scaphoid bone of the wrist joint.

TREATMENT

Local anaesthesia is ideal for a Bennett's fracture. The skin around the fracture site is thoroughly prepared with ether and 2 per cent solution of iodine. About 3 to 5 c.cm. of 2 per cent novocain is injected into the fracture and about 1 c.cm. into the pad of the thumb for the insertion of a stirrup. When the anaesthetic has had time to take effect the stirrup is inserted transversely through the soft tissues of the pad of the thumb passing on the palmar aspect of the terminal phalanx but not through the bone. Traction is applied by an assistant in the long axis of the thumb to correct upward displacement while countertraction is produced by passing round the arm with the elbow flexed at a right angle a strong flannel bandage which is fixed to a wall or to a radiator. traction and countertraction are maintained throughout the reduction. Very strong pressure is then applied to the base of the thumb in order to reduce the outward displacement.

When the deformity has been reduced satisfactorily an unpadded plaster of Paris slab is applied to the dorsal aspect of the forearm from just below the elbow down to the knuckles a plaster bandage is then bound round the forearm and base of the thumb up to its interphalangeal joint as in Fig. 1. The plaster must be firmly moulded

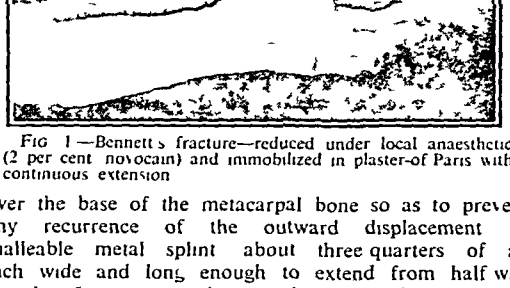

FIG. 1.—Bennett's fracture—reduced under local anaesthetic (2 per cent novocain) and immobilized in plaster-of-Paris with continuous extension.

over the base of the metacarpal bone so as to prevent any recurrence of the outward displacement. A malleable metal splint about three quarters of an inch wide and long enough to extend from half way up the forearm to three inches beyond the tip of the thumb is then incorporated in the plaster. the end of the metal splint should have been bent at a right angle for about half an inch and should have a central hole to take a hook for traction purposes. This hook is placed through the hole and its end engaged with the stirrup a screw is next wound on to the hook beyond the splint and gradually tightened until the thumb is firmly extended. The plaster is allowed to set and a radiograph is then taken. If the traction force is insufficient it can be increased by tightening the screw. By this method accurate reduction can be easily obtained.

The fixation is maintained until some evidence of union in the nature of callus can be detected on *x* ray examination this is usually a matter of three to five weeks. During that time the patient is instructed to use his fingers actively there being no plaster in the palm of the hand to prevent full flexion of the fingers. After the plaster has been

removed a certain amount of stiffness of the thumb will result, but with active use this stiffness will gradually disappear and full function will be restored in about eight weeks or so from the onset of treatment

Fractures of the Metacarpal Bones

The metacarpal bones may be fractured either by direct or by indirect force with the former, as often happens when a hand is caught in machinery, usually more than one bone is fractured and there is much associated injury to the surrounding soft structures—for example, to the tendons and to the skin—causing at times an open fracture When indirect violence is responsible for the metacarpal fracture there may be some displacement with backward angulation, due chiefly to the pull of the interossei muscles but undoubtedly influenced to some extent by the normal palmar concavity of the metacarpals When the metacarpal bone of the thumb is affected the fracture is generally situated towards the proximal end of the shaft, is transverse, and the distal longer fragment is adducted relatively to the smaller proximal fragment

TREATMENT

Treatment of fracture of the thumb metacarpal consists essentially in the correction of this adduction deformity of the distal fragment by very powerful abduction of the extended thumb, which is then, together with the wrist-joint immobilized in plaster of-Paris, the thumb being held in abduction and fixed up to but not including the interphalangeal joint all the fingers are kept free for full active movements Fixation is maintained for three to four

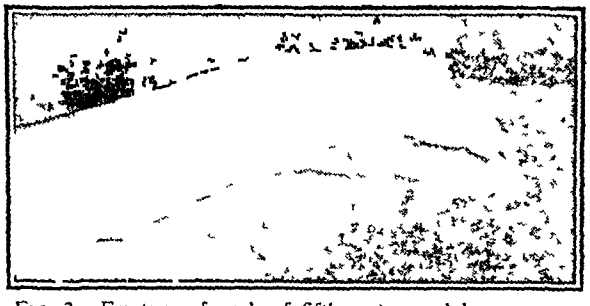

FIG 2—Fracture of neck of fifth metacarpal bone, causing angulation of metacarpal head—a fairly common type of fracture Under local anaesthetic (2 per cent novocain) the displacement was reduced then immobilized in plaster of Paris, the little finger being fixed to a finger splint, bent as shown in the illustration

weeks, when union is as a rule well advanced If the fingers have been freely used the residual stiffness of the wrist-joint and thumb quickly disappears

In fracture of the base of any of the finger metacarpal bones there is practically no displacement, on account of strong ligamentous attachment The fracture should be immobilized by an unpadded plaster-of Paris slab from just below the elbow to just distal to the knuckles, with a circular plaster bandage fixing the slab to the forearm and wrist Adhesive strapping attaches the lower end of the slab to the hand around the knuckles in such a way that full range of movement of the fingers is possible A fracture of the shaft or of the head of a metacarpal bone *without displacement* is treated in similar fashion

Any displacement of a shaft or head metacarpal fracture is reduced by long-axis traction through the finger of the affected metacarpal bone, while countertraction is applied to the forearm strong local pressure will then correct any angulation With traction maintained, a plaster-of Paris cast is applied as described for basal fractures with the exception that the slab is carried further beyond the knuckles and is well moulded in over the dorsum of the injured metacarpal or metacarpals so as to prevent a recurrence of backward angulation A malleable metal splint half an inch wide is then incorporated in the plaster on the anterior aspect of the forearm and hand and the finger of the affected metacarpal bone is fixed to this splint in a flexed position by means of either adhesive plaster or plaster-of Paris (Fig 2) If one or two metacarpal bones have been fractured, with resulting displacement, each finger is treated with a separate finger splint, but with involvement of three or more metacarpal bones it is advisable to immobilize the hand by bandaging the fingers over a roller bandage placed in the palm This latter method has the disadvantage that active movements of the unaffected fingers cannot be performed while the fracture is being immobilized, but when three fingers at least are immobilized it is obvious that active movements will be in abeyance—hence the disadvantage disappears

A metacarpal fracture should be immobilized in plaster on an average for four to six weeks, stress being placed on active movements of the un-immobilized fingers during this period The stiffness of the immobilized fingers will gradually disappear with active use over a period of generally three to four weeks, especially so if the un immobilized fingers have been freely used, there is no need for any massage or passive movements to be prescribed for the residual stiffness of immobilized fingers —in fact, such treatment may be harmful and cause more stiffness and pain

(To be concluded)

MEDICAL UNEMPLOYMENT IN INDIA

The *Calcutta Medical Journal* for July has an interesting editorial on unemployment in the medical profession in India It makes an appeal to the senior members of the profession to take stock of the situation and to do their utmost to change the plight of their young colleagues It asks them to save the prestige and fair name of the profession

It must be admitted that, in spite of the large size of India and the relatively few practitioners to the total population, many graduates of Indian universities are suffering great hardship It is not overstating the case to say that a number of them are dependent on the charity of their relatives

An Overcrowded Profession

The medical profession of India—and under this head I include only those trained in scientific medicine—is overcrowded In 1937, when Aden came under the Colonial Office, the Aden Government advertised for eleven sub assistant surgeons Aden is a desolate spot and to an Indian it represents service over-seas and wide separation from friends and family The advertisement offered a salary equivalent to £170 per annum, rising in six years to a maximum of £256 per annum and an agreement in the first place for three years They received no fewer than 1,465 applications Of these 1,465 applicants 14 held British qualifications, and 26 others held higher qualifications obtained in England—4 M R C P, 2 F R C S and 8 D P H, 12 other diplomas That there were 1,465 registered practitioners competing for a post in a subordinate position at a salary of £170 per annum outside their own country is sufficient proof of the very poor return a medical graduate obtains for his six or seven years education and hard work

The facts are that unless a graduate can obtain a Government appointment he cannot make a living in private practice outside the towns It was hoped at one time that economic pressure would force the

graduates to settle down and practise in the rural areas I have heard senior medical officers with a wide knowledge of India say that this was the only solution to the provision of medical relief in the rural areas For this reason it would be to the benefit of India to see the profession reduced to its present condition In making this statement they overlooked the fact that a rural area of reasonable size is unable to support a practitioner The peasantry of India have no income to spare for medical treatment To some extent they could pay in kind but they certainly have no funds with which to pay an adequate fee in cash Moreover communications are poor and in many provinces the inhabitants are scattered and live on their own homesteads separated by the fields they till

The Hold of Indigenous Medicine

It is only among the highly educated classes that there is any real belief in scientific medicine From time immemorial the peasant has been accustomed to go to his Ayurvedic or Yunnani physician for medical treatment The indigenous practitioner's position in the village is supported by all the weight of tradition and religion His family have practised for generations in the village and the practice is handed on from father to son The practitioner of scientific medicine has very little chance in competition with the indigenous practitioner in rural areas Even in the towns a large proportion of the educated classes still believe in their indigenous systems of medicine These systems of medicine are comparable with Western medicine in the days of Chaucer Their theories and practice are much the same nevertheless the people have the same faith in them as our peasantry and educated classes had in their physicians in Chaucer's time Surgery perhaps has made greater progress in the minds of the people largely because of the tangible results which are seen in cataract and hydrocele operations The private practitioner in the small villages however is not concerned with surgery but rather with the medical relief of the ordinary ills to which the villagers are subject On the standard of living of an Indian peasant not only is his advice expensive but so also are his remedies The result is that his services are practically not utilized and even the best of practitioners find it difficult to make a living in the rural areas Graduates born and bred in rural areas who have had a college career in Presidency towns learn to appreciate the amenities of life in towns and can no longer settle down to the quiet and primitive conditions of their local village even if a living were available The result is that almost all graduates start practice in the towns

Scientific Medicine at a Discount

There are comparatively few large towns in India as the population is mainly an agricultural one Industries have centred round Calcutta Bombay Cawnpore and Ahmedabad Even in these towns a large proportion of the population still adhere to the indigenous system of medicine and will do so for many generations The result is that the supply has outrun the demand for scientific medicine and the Indian universities are still turning out graduates for whom there is no employment

No medical graduate starts his career with higher ideals and a stricter code of ethics than the Indian He has received a good medical education and, given an opportunity would maintain his professional standards and ethics at a high level The severe pressure of economic facts however gradually wears him down and the necessity for making a living somehow leads to a lowering of both his professional standards and his ethics Scientific medicine is having a hard fight to maintain itself in the face of fierce competition and it can only win through in the long run by its better results and its high professional standards It is therefore the concern of everybody interested in the spread of medicine in India to try to remedy the present deplorable state of affairs Not only has the university graduate to compete with indigenous systems of medicine but he has also to compete with a large number of practitioners who are trained to lower standards and are of an inferior status

Three Competing Grades of Practitioners

In India three grades of practitioners are practising Western medicine The first is the university graduate fully trained and up to standards which the General Medical Council is able to recognize as equivalent to British standards The second is the sub assistant surgeon who has a shorter course of training He is turned out in larger numbers and starts with an inferior education The third is the compounder who has a short training in a dispensary His real function is as his name implies a pharmacist However he frequently sets up in practice and competes with the two senior grades Over and above this the graduate has to face competition from practitioners of homoeopathy osteopathy and others who have obtained either by correspondence or by payment diplomas from foreign schools and colleges The populace as a whole are not able to judge the merits of these varying qualifications and regard all who hold them as practitioners of scientific medicine

Possible Remedies

It is difficult to suggest a remedy for this state of affairs There are some measures which can be taken We have seen that restriction of output has become a feature of many industries It would seem that some similar restriction should be placed on the output of practitioners in India and that the supply should be adjusted to the demand To ensure the spread of scientific medicine in India it is essential that all its practitioners should be of the very highest standard More harm has been done to the spread of scientific medicine by the poor standards of practice than by any other single factor

The first step heretofore would appear to be the abolition of the sub assistant surgeon's qualifications This class starts with an inferior education and has a four-years course In some provinces this has now been raised to a five years course but the general provision for adequate training is still very inferior He is eligible for admission on the Provincial Register He is generally of a lower social status and lower preliminary education than the university graduate He is turned out in much larger numbers than the graduate and is a very severe competitor for practice

The universities themselves should restrict their admissions to meet the demand This is done to some extent at present the admissions being considerably less than the number of applications but even now selection needs to be more strictly applied With the abolition of the sub assistant surgeons the Government could assist by requiring that in future all Government and local authority dispensaries should be staffed by university graduates

In most towns hospital abuse is general and many of those attending hospitals belong to the educated classes who could afford to employ a private practitioner More efforts might be made to restrict this without causing any hardship to the individuals In industrial areas the introduction of sick insurance for industrial workers would afford employment to a large number of practitioners and leave the patients free to choose their doctor

It is reasonable to suggest that the Indian universities themselves should take some action in this matter and in association with the Government appoint a committee to inquire into the general conditions of medical practice in India to make suggestions for the spread of scientific medicine and propose measures for the relief of unemployment among medical graduates

A. H Proctor

FRACTURE OF THE NECK OF THE FEMUR

A PERSONAL EXPERIENCE

BY

JOHN C NICHOLSON, B M , F.R.C.S

Late Surgical Registrar Royal National Orthopaedic Hospital

It is often stated that doctors suffer from those diseases in which they are specially interested, and besides the classical examples of John Hunter, Robert Liston, and others, we must all have known contemporary consultants who have contracted the disease in the treatment of which they specialized It seems only fitting, since I aspire to become an orthopaedic surgeon and look after a small fracture clinic, that I should myself sustain an unusual and severe type of fracture of the neck of the femur at (for this fracture) the early age of 34 I think it may be of value to put forward my recent experience of the various methods of treatment of this fracture from the patient's rather than from the surgeon's point of view As it happens I have had a taste of all the methods at present in vogue with the exception of primary osteotomy—namely, sandbags, extension by adhesive plaster, extension by Kirschner wire, Whitman plaster, and the modern edition of the Smith Petersen operation

Ollerenshaw (1938) states 'It is probably safe to say that at the present time 95 per cent of fractures of the neck of the femur are being treated by one or other modification of the Smith-Petersen nailing operation" However true this may be in Manchester, it is certainly not the case in London When I was advised to have my own fracture nailed, I was told by one of the leading London orthopaedic surgeons that neither he nor any of the other surgeons doing ordinary consulting work in London had any great experience of this operation at present (a statement with which I am in agreement, from my own observation), and that the only men in London who had operated on many of these cases were to be found on the full-time staff of the L C C hospitals It was therefore arranged that I should be moved to one of these hospitals, where every care was taken of me and the operation was most expertly carried out Even there, however, I was told that not nearly as many as 90 per cent of the cases of fracture of the neck of the femur admitted to the hospital were "pinned"

This lack of opportunity to practise a new and expeditious method of treatment in the voluntary hospitals is due to the short-sighted policy of these hospitals in the past in refusing to admit cases which will "block a bed for three months' Now such cases are nearly all sent direct to the L C C hospitals, and since most surgeons are unwilling to experiment with a new and difficult method on their private patients, I believe that the Whitman plaster or some form of extension may be regarded as the standard method of treatment practised in London—apart from the L C C hospitals—at the present time The history of my own case is as follows

Case Report

February 4—I slipped down in the passage at my home and struck the right thigh against a step The sensation was absolutely characteristic, and I knew at once what I had done With the aid of a broom, which I used as a crutch, I was able to get upstairs to the telephone to summon assistance I was removed by ambulance to hospital, where the leg was laid between sandbags for the night

February 5—Radiographs showed a comminuted fracture of the neck and lower part of the head of the femur, with coxa vara and external rotation Thomas's splint and adhesive plaster extension with 14 lb weight were applied

February 11—Under a general anaesthetic two separate attempts at reduction by the Whitman method controlled by x rays were made A Bohler type of Whitman plaster was then applied, extending from the axillae to the toes An accidental injury to my right axillary nerve during the operation caused paralysis of the deltoid, which did not recover for some weeks Because of this, my experience of plaster was perhaps less agreeable than it might otherwise have been as I was rendered completely helpless except for the ability to use my tongue and my left arm Further x ray examination revealed incomplete reduction and persistent external rotation, then the plaster broke

February 17—A new plaster was applied, on this occasion without the use of anaesthesia Owing to an accident with the x ray plant the fracture was further displaced The plaster set well, but the position, as shown by subsequent x-rays, was too bad to be left As I had had enough of plaster by this time, and as my advisers were doubtful if union would take place by continuing on these lines, it was thought advisable to have the femur "pinned" in spite of the badly comminuted nature of the fracture and the difficulty in obtaining proper reduction

February 24—On this date I was transferred to an L C C hospital

February 25—The plaster was removed, radiographs were taken, and the position of the fracture was found to be unsatisfactory A Kirschner wire was inserted through the tuberosity of the tibia and 16 lb weight extension applied

February 28—Further x-ray examination showed the position to be still unsatisfactory, the weight extension was increased to 24 lb

March 4—Operation was undertaken under general anaesthesia *X*-ray examination revealed that the coxa vara was reduced, but the lateral views showed that the marked external rotation persisted unchanged, this could not be corrected by manipulation in spite of several attempts It was decided to insert the pin with the position as it was, a course with which I would have been in entire agreement The pin was therefore inserted by a modification of the method described by Hey Groves

March 13—The stitches were removed, and a haematoma which had formed under the scar was evacuated, the wound healed in a few days

March 23—I got up in a chair

March 25—On this day, exactly three weeks after the operation, I started walking with crutches

April 1—I was discharged from the hospital and went home I could bear weight on the leg though this was painful, a full range of movement was present at the knee and practically a full range at the hip, although the whole musculature of the limb was very wasted owing to the previous extension and immobilization in plaster

Pridie (1938) suggests that the present is not the best time for discussing the relative merits of this operation as compared with other methods of treatment, but in the meantime those of us who have to treat fractures are still obliged to make up our minds as to which is the best method to adopt This being so I think that a few observations on the various alternatives "from the patient's point of view" might be of value

Sandbags

Sandbags are generally used as a temporary measure only, the fracture is in no way immobilized, and any movement—especially those necessary in the nursing of the patient—is most painful I think in all cases some form of extension, however simple, should be instituted as soon as the patient is in bed I am convinced that pain and shock are minimized by doing this The old idea of leaving things alone for twenty-four hours or so has nothing whatever to recommend it from the patient, or any other, point of view

Weight Extension

As soon as adequate weight extension has been applied practically all pain at the site of the fracture is abolished—in really most dramatic fashion Provided the weight is kept on moving about in bed is not painful so long as the fracture is kept distracted Adhesive plaster extension if the plaster extends high enough is not unduly uncomfortable, but it has the disadvantage of immobilizing the knee and also the extension has to be carefully adjusted to prevent discomfort round the ankle Pulling the plaster off completely depilates a hairy leg and leaves the skin sore for quite a long time Extension by Kirschner wire through the tuberosity of the tibia on the whole is less uncomfortable It allows some movement of the knee although a heavy weight—24 lb—begins to stretch the knee joint unduly and render it stiff and painful and subsequently weak

I found that the insertion of the wire under local anaesthesia was extremely painful particularly while the point of the wire was boring through the bone which is not reached by the local anaesthetic If the wire is not in the true transverse axis to the line of pull it tends to slip and the necessary pulling it back again is also painful In practice I have found that a Steinmann's pin is far less uncomfortable for the patient than a wire and for this reason I prefer it Another point is that a pin inserted above the knee is preferable and no more liable to give rise to trouble than one below the knee provided proper care be taken and the extension is not left on for too long a period In my experience it is best to manipulate the leg into position and put in a Steinmann's pin under a short N O anaesthesia in bed The two ends of the pin are tied by cords attached to Whitehurch Howell's screw collars to the end of the splint through which traction is applied to the whole limb

Plaster-of Paris

Although one constantly puts patients into plaster and most of us show very little sympathy with their complaints a surgeon unless he has tried it cannot possibly know what the patient has to put up with when a large part of his body has been immobilized in this way I had practically unpadded Whitman plasters with the leg in the fullest abduction possible the plaster extending from the toes and enclosing the whole chest up to the axillae an opening being left over the abdomen for respiratory purposes Such a plaster renders one absolutely helpless except for the arms It allows of no degree of spinal flexion and practically everything has to be done for one by nurses which entails constant attention if life is to remain at all endurable Of course one has to remain in the same position on the back continually, to sleep or lie awake After the plaster has been applied only the patient realizes that it takes about three days to dry during which time it is very cold, in spite of hot water bottles etc Owing to this and the enforced immobilization the limb becomes quite cold and numb which must have a very bad effect on old and bronchitic patients Any irregularities on the inner surface of the plaster especially round the foot, become a constant source of irritation and annoyance Such minor lapses in technique as filling the patient's umbilicus with plaster or leaving his cold and rather sensitive toes embedded in plaster are all very real discomforts which become far more intolerable in time than even a moderate degree of straightforward pain

So far as I was concerned the prospect of being left in plaster for anything from three to six months or possibly even longer, was almost unbearable I suppose one becomes used to it but I have found that most of my patients take the same view and having once tried it would submit to almost anything rather than the discomfort of a big hip plaster There are also of course important economic considerations A patient in such a plaster is very nearly helpless and requires assistance even with his bodily functions to say nothing of keeping his body clean he can do very little for himself whether his position is horizontal or vertical—the only two alternatives—and few of these patients are out of plaster in less than six months Several of my cases which have done well have not been entirely free from plaster for ten to twelve months Another grave disadvantage of immobilization in plaster is that all the other joints which are immobilized become very stiff Even after the short period I spent in plaster recovery of mobility in the ankle and knee was slow and painful After prolonged immobilization it may be months before recovery takes place and in most of the older patients a full range of movement particularly at the knee is never restored at all The muscles waste rapidly at the same time and recovery (again even in my own case) is quite a lengthy proceeding while the skin gets into very bad condition under the plaster and is liable to persistent irritation The prevention of sores at the edges of the plaster is also a very real difficulty All these discomforts and disadvantages are done away with by the employment of operative fixation

Radiologically Controlled Nailing

In my case a good deal of manipulation was necessary the operation was moderately severe and prolonged and I lost those advantages gained by operating within a few days of sustaining the injury Except for a certain amount of soreness at the site of incision and some pain in the hip for the first few days I was very comfortable After a day or two I could move the hip and knee and in about ten days had managed to regain full movement of the knee which had been quite stiff to start with I found resting the leg on a Braun's splint was uncomfortable and therefore discarded the splint in favour of a pillow under the knee after the first day At first the most comfortable position in which to sleep was on the back with the knees drawn up at an angle of 45 degrees it was four weeks before I could sleep on one side or the other

Four weeks after the operation when I went home I could walk well on crutches reach any part of my body bath and dress myself without help lace my own shoes sit in any chair with comfort and drive my own car Eleven weeks after the accident and seven weeks since the insertion of the pin I was doing my surgical work which includes attending out patient clinics going round the wards and performing operations Twelve weeks from the operation I climbed the North Cape (900 feet) while on holiday in Norway and four months from the operation I am quite normal and can walk as far as I could before although I cannot run yet I have a full range of movement and no pain and recent skiagrams show the pin to be unchanged in position and good bony union to be taking place

Most of the arguments for and against the operative treatment of fracture of the neck of the femur centre round the question of ultimate union The argument most commonly advanced in favour of operation is that union is more likely to occur in a fracture in which it is notoriously difficult to obtain union Exponents of the more conservative methods cite those cases in which the fracture has been nailed and has gone wrong complications such as aseptic necrosis of the head leading to non union or cutting out loosening or working out of the pin arising soon or as late as three years after the operation I have seen examples of all these complications although I have yet to see a pin break as 8 per cent of Mr Eric Lloyd's (1938) appear to do I should have thought that no properly made pin of good quality steel should break I believe some of these complications are due to faulty operative technique but I have also had a number of patients treated by conservative methods—Whitman plaster or extension—in whom non-union and other complications have occurred It is not my purpose however to argue as to which method is most likely to

result in union, for nobody can say that for certain at present, but I wish to put in a strong plea in favour of operation on account of the greatly increased comfort and well-being of the patient, the fact that other joints are not immobilized more or less permanently, and the great saving of time in "getting the patient about" So anxious am I to dispense with prolonged immobilization in plaster that, in the last two cases in which I have carried out arthrodesis of the hip, after intra-articular excision of the joint, I have fixed it at once by driving a long tri-flanged nail into the acetabulum This procedure has been most successful the operation is much quicker and less severe than the standard method, and the patients are up and free from plaster in two or three weeks instead of three or four months

Some Comments

My personal experience of operative methods has been limited to a few cases, and the results have been encouraging, but until now my routine method of treatment, in patients fit to stand it, has been the Whitman plaster From what I have heard and seen of other people's results, added to my own experience, I am convinced that the results obtained by the radiologically controlled operation, provided it is carried out properly and the pin is correctly placed, are at least as good as, if not better than, those obtained by the older methods Admittedly, the operation and especially the all-important radiological part of it are difficult until the "team" has attained the necessary proficiency, but to my mind the enormous advantages from the patient's point of view outweigh the possible disadvantages I regard this as one of the greatest advances of modern surgery, and in old patients I believe it to be a life-saving operation in many cases As to the chances that the presence of a metal pin in the bone may lead to delayed union, I think this factor is more than counterbalanced by the adequate fixation of the fragments obtained, for even an unpadded Whitman plaster does not procure complete immobilization, as I easily proved for myself When the pin has done its work and the fracture is soundly united I believe that it should be removed —a trivial operation which should be a routine in all cases

To minimize difficulties and risks only tends to discredit any method of treatment, however good, and such statements as the operation can be completed in fifteen minutes, or " one antero-posterior x-ray will suffice," are either untrue or mean that the operation has not been carried out properly, and that the unnecessary risk of a badly placed pin has been taken Even in the hands of a team of experts the whole procedure with the necessary radiological control is unlikely to take much under the hour, and I find on inquiry at Sven Johansson's clinic in Gothenburg that their experience is the same in this respect

With regard to primary osteotomy, as advocated by McMurray (1938), I cannot see the object of virtually assuming that non-union is likely to occur until at least some attempt has been made to obtain union by the ordinary methods The Lorenz operation and intertrochanteric osteotomy give very good results in ununited fractures of the femoral neck, but why should it be necessary to do an operation of this type, which will give a poorer hip-joint functionally before attempting to obtain union by direct fixation of the fragments? It seems to me to be a counsel of despair Another point is that McMurray's operation entails prolonged immobilization in plaster with all its disadvantages, whereas the insertion With the Smith Petersen pin does not If the nailing operable to get then it is time to consider an osteotomy and I was remov plaster
laid between sa

Conclusion

February 5—Radio of the neck and lower part sessions' experiences have firmly cova ara and external rotation Thetically controlled Smithplaster extension with 14 lb weight wechoice If my femoral head aseptically necroses, or the fracture has failed to unite, or the pin drops out, I should still think that th result might have been as bad if I had remained in plaster, and only then should I consider the advisability of osteotomy I respectfully disagree with Mr Eric Lloyd (1938), and believe that all fractures which can possibly be nailed—even "lateral fractures"—should be, provided the surgeon is competent to do it properly Personally I have now had the opportunity of receiving instruction from masters in the method, and having with me the most convincing argument of all—my own hip joint—I shall not put another patient with a fracture of the neck of the femur into a Whitman plaster, valuable though the method has proved in the past, unless I am forced to do so I believe that any patient who is fit to stand treatment by plaster is also fit to undergo this operation

I should like to take this opportunity of expressing my great appreciation of all the care, kindness and skill with which I have been treated by each of the three surgeons, two of them old 'chiefs' of mine, who undertook my case I am afraid I was a very troublesome patient, but the experience has taught me a lot This article was written at their suggestion, and nothing I have said in it is intended to be in any way a criticism of their skill or judgment, for which I have the highest possible regard

THE BRITISH ASSOCIATION AT CAMBRIDGE

The main aim of the British Association for the Advancement of Science, which has just held its annual meeting at Cambridge, was described by Mr H G WELLS as the consideration of science in a changing world Lord RAYLEIGH in his presidential address on vision in nature and vision aided by science, showed how the newly devised aids to vision had revealed new aspects of the material world which to the unaided senses appeared almost paradoxical, although such modern scientific doctrine appeared to have an elusive and even meta physical character, it had revealed tangible facts by methods akin to direct scrutiny, and it remained true in a rather extended sense that seeing was still believing More than on other previous similar occasions the relations of scientific activities to the everyday facts of life in the world were indicated Lord Rayleigh took occasion to dissent from the older view that advances in science were aetiologically concerned with increasing animosities in mankind, and in the Geography Section its president, Professor GRIFFITH TAYLOR suggested that racial prejudice might well be considered to be only another term for ethnographical ignorance

In the Psychology Section Dr WILLIAM BROWN dealt strikingly with problems of the mature personality, a new departure for some of his audience, again illustrating the benevolent contributions of science to a far from stable world In the same section Mr J G W DAVIES defined the satisfactory state of vocational adjustment as being one in which a person could find in his occupation a sufficient outlet for his abilities, interests, and disposition characteristics, feeling at the same time that he was comparing adequately with his competitors in efficiency, and knowing that within the terms of his expectations he was holding his own as an economic unit

Some Physical Problems

In a symposium on nuclear physics Professor NEILS BOHR of Copenhagen, who had formerly collaborated with the late Lord Rutherford, brought out the fundamental differences between the conceptions which had evolved

from the quantum theory of the atomic nucleus and those which were derivable on the basis of classical mechanics there was a great facility of energy exchange between the nuclear particles and a new particle the yukon so named from its discoverer Yukowa was intermediate in mass between the proton and electron Later in the symposium two transmutations were discussed—namely that of carbon to radio active nitrogen and also of fluorine to neon Current teaching about the chemistry of gold was criticized by Professor CHARLES GIBSON who also demonstrated chemical methods of making gold films for industrial and decorative purposes Dr C G DARWIN'S presidential address in the Section of Mathematical and Physical Sciences dealt with logic and probability in physics He maintained that the old formal logic was designed for a world which was supposed to have hard outlines whereas the new mechanics had shown that the outlines were not hard, and that the method of reasoning must be altered accordingly The subject of probability ought to play a much greater part in the education of the physicist as well as of the ordinary layman For instance the monthly variations in the Transport Ministry's monthly reports on road accidents were probably more natural fluctuations due to chance

Visual Perception

In the Section of Psychology Dr R H THOULESS delivered a presidential address on the eye and brain as factors in visual projection pointing out that visual perception was not only a sensory affair and that the phenomenal regression towards reality differed in different persons and at different ages, the same scene such as gaps in road traffic being seen in various ways Those persons who had been taught to trust the evidence of their own senses became cross when challenged by others A person of high phenomenal regression could drive a motor car more easily through traffic than could one with low regression seeing a gap in traffic at something near to its actual size before he reached it Alcohol decreased phenomenal regression while caffeine increased it The common persistent tendency to drive on the crown of the road characterized persons of low phenomenal regression but an understanding by the driver of the cause of his fault would help him to correct it SIR ARTHUR KEITH contributed to a symposium on the Swanscombe find in the Section of Anthropology Mr JOHN SARGENT expressed the belief that the minimum size of any local government unit should be an area with a population of 250 000, this was followed by a two day discussion of education for a changing society in which great differences of opinion as to policy and procedure were expressed

Social Relations of Science

The general committee of the British Association discussed a proposal to create a new division to deal with the social and international relations of science A committee appointed annually would furnish material for the information of the public, would act in a consultative manner and establish relations with organizations and persons engaged in practical administration would set up subcommittees for executive purposes or for research, inquiry or co ordination and would maintain close relations with the sections of the Association inviting their advice and receiving from them suggestions of subjects for discussion This committee would meet regularly through the year at intervals determined by itself

Since 1913 the number of doctors in Belgium has risen from 4 426 (one doctor to every 1 726 inhabitants) to 6 311 in 1935 (one doctor to 1 315 inhabitants) In the province of Brabant in 1913 there was one doctor to every 1 107 inhabitants and in 1935 when Brabant had a population of one and three quarter million inhabitants one to every 938

Local News

INDIA

Countess of Dufferin's Fund

It is announced in the annual report for 1937 of the National Association for Supplying Medical Aid by Women to the Women of India (Countess of Dufferin's Fund including the Women's Medical Service) that in that year there was a definite expansion of the work of the association two new branches of the Fund having been initiated, one in the new Province of Orissa and the other in the Province of Sind In both these Provinces medical aid to women is still in a backward state but it is hoped that the two new branches will supply the much needed stimulus The United Kingdom branch of the Fund has been closed in view of the great reduction in its work during recent years Accommodation has been found in London in the office of the High Commissioner at India House for arrangements for the education in the United Kingdom of undergraduate medical women and for the recruitment of English women graduates for service in India as well as for the reception and assistance of members of the Women's Medical Service and of Dufferin scholars in the United Kingdom In April, 1937 the Government of India undertook the full financial responsibility for the maternity and child welfare section of the India Institute of Hygiene and Public Health, Calcutta The rebuilding of the Dufferin Hospital Calcutta proceeded as rapidly as could be expected during the year under review massive foundations having to be laid on the marshy soil of Calcutta and steel having to be procured the work in the old building has been handicapped meanwhile two wards having necessarily to be closed to patients while the theatre was put out of action for operative work The number of new admissions consequently fell but there was an increase to 1 121 in the number of maternity cases delivered as well as in the number of out-patients The new dental department has been opened A preliminary training school for nurses was held three times in 1937 for periods of two months and proved to be most popular and valuable Investigations were continued into the anaemia of pregnancy of which there seems to be an increasing number of admissions each year the patients being almost *in extremis* and often with many complications There is still no money available for equipping the new building and a new nurses home is urgently needed At present one third of the hospital's expenditure is met by payments from patients and it is hoped that with further accommodation including additional private rooms, the income from this source will grow proportionately The hospital will eventually be a first class medical and surgical treatment centre for women and children a *modern training school for nurses a post*-graduate training centre for medical women and a research centre The new hospitals of the Fund at Shillong and Khamgaon are progressing excellently and are proving most valuable in their respective districts It is insisted in the report of the Fund that the great need in India to day is for a better educated and better trained nursing service this can only evolve when more suitable conditions for training will attract to the nursing profession Indian girls of better class who will enter it with a vocation for nursing and with ideals of service The executive committee of the Dufferin Fund has consequently earmarked the unspent balance of the Silver Jubilee Fund, amounting to over 71 000 rupees for grants for rebuilding and improving nurses quarters for increasing teaching equipment in training schools for nurses and for providing teaching allowances for sister tutors and salaries for additional staff nurses It is also proposed to award scholarships to trained nurses to enable them to take courses in administration in large hospitals so as to fit them for administrative posts Regret is expressed at the

poor financial support given to women's hospitals in India by the local authorities and it is noted that while the number of women and children availing themselves of treatment increases steadily the financial support of the public is diminishing In most of the hospitals there is serious overcrowding which is yearly becoming more acute and the continuance of the work is threatened An inquiry into maternal mortality and morbidity in childbirth is proceeding in Calcutta under the Women's Medical Service and the Indian Research Fund Association The Lady Hardinge Medical College New Delhi, receives an annual grant from the Government of India smaller grants from Provincial Governments and some Indian States as well as fees from students and some patients

Plague in Bombay

An abnormally low mortality from plague was an outstanding feature of the health of Bombay in 1936, and in the seventy third annual report of the Director of Public Health for the Government of Bombay Lieutenant-Colonel A Y Dabholkar, I M S quotes the annual statistics since 1914 to support his contention that, although there are occasional epidemic waves there has been a progressive decline in incidence The peaks reached by epidemics during recent years are low compared with those in earlier ones and it is suggested that the anti-plague measures including calcium cyanide fumigation, which are being organized by the Government and by local authorities in the epidemic centres have materially influenced the trend of these epidemics It is even hoped that the application of more systematic and sustained measures will result in the complete eradication of this disease Ratting operations involving the use of fumigation were undertaken in various areas, including Bombay City but the warning is given that the decline in the incidence of plague must not be taken as an excuse for not continuing and intensifying this work until the rat population has been reduced to a minimum, in spite of the natural tendency to increase of this pest The mere use of traps and baits is inadequate to this end and demonstration cyanogas operations have been conducted in several districts under Government control, additional subordinate medical officers and staffs being appointed for this purpose There was a regrettable decline in the number of inoculations, but the vaccine used in the Presidency proved very satisfactory In one district which had 677 plague patients only seventy-one had been inoculated the case percentage mortality being 43, while among the 606 uninoculated cases the death rate was 57 per cent No special medical officers were required for plague inoculation duty Colonel Dabholkar is satisfied that the employment of hydrogen cyanide in one or other of its various forms can now be recommended for use with complete confidence and can well replace the other less efficient methods of disinfestation In 1936 the plague mortality in the Presidency was the lowest ever recorded since 1896 the year in which plague first appeared there Of the 4320 deaths from small-pox 1,176 involved infants under the age of 12 months and 71 per cent of the deaths occurred in children These figures emphasize the need for a more thorough application of vaccination among the population in this susceptible age period Thus in Bombay two of the most fatal diseases in India appear to be capable of control Various sanitary associations are pushing on energetically with the work of health propaganda lantern lectures demonstrations, and local exhibitions being very popular and facilitating the introduction of sanitary measures for villages The position is less happy in respect of diseases of the respiratory system Deaths from pulmonary tuberculosis have been steadily increasing in recent years and Colonel Dabholkar marks that the importance of early diagnosis and notification which are the first line of attack has not yet been fully realized nor has the pressure of public opinion been brought to bear on the local authorities to make them pay sufficient attention to this menace, which is obviously increasing

NEW ZEALAND

[FROM OUR CORRESPONDENT IN WELLINGTON]

The Cost of Social Services

The payment of old age pensions began in New Zealand in 1899 In the succeeding thirty-eight years the population doubled, but the number of pensions has been multiplied by nine If plans now in view are adopted the cost of pensions will double again It has grown from £157,000 to over seven and three-quarter million pounds The causes of this huge increase are many Immigration and the birth rate have declined, the cost of living has progressively increased, qualification for pensions has been eased, war pensions have been necessary, and there is an ever-widening demand for pensions It is not surprising therefore, that taxation has increased during the last three years by about 50 per cent There is a distinct tendency to encourage dependence on the State, and thrift, effort and enterprise must be taxed to support such people as are unprofitable New Zealand is now at a peak of prosperity and may be able to afford the cost of social security as it is called, but if the value of exports decreases unproductive expenditure may be the first to be curtailed

National Health Scheme

An outline of the Government's proposed national health service has been supplied by the parliamentary chairman of the National Health Insurance Committee and may be accepted as a correct summary of the National Health Insurance Bill to be introduced shortly The scheme will not be put into practice before April 1, 1939, and in the meantime a General Election will be held the Opposition may succeed at the election, and this may lead to an amendment of the legislation Mr Nordmeyer, chairman of the committee, said that the real wealth of the community lay in its men and women, boys and girls, anything which tended to increase their health and well-being tended to increase the community's wealth Many countries had discovered the value of health insurance by means of which medical costs could be spread more or less equitably throughout the community and more or less equally throughout the individual's life Medical costs fell so heavily and so uncertainly that they could not be met by the average individual The middle class suffered most severely, the poor, of necessity, were usually treated free but those who were regarded as able to pay were expected to pay, often at the cost of real hardship over a number of years When the British health insurance scheme was instituted the doctors almost unanimously opposed it, announcing that they would not co-operate, Mr Lloyd George, however, went on with his scheme, and it was now a huge success, and the doctors themselves were asking for its extension Mr Nordmeyer went on to deal specifically with the social security proposals, of which, he said, health insurance was an important part

It was proposed, he continued, to institute a general practitioner service free to all The names of the doctors willing to work under the scheme would be published, and people would be free to choose their own doctor and to change him at the end of three months if they wished The Government realized that the doctors must be adequately paid for their services and £1,200 000 had been set aside for that purpose, that sum was greater than the sum doctors were at present receiving in the aggregate There was also to be a free hospital service Hospital boards were to be paid 6s a day for each patient The average amount at present collected daily for each bed was 2s 8d only a small fraction of the actual cost Hospital boards would thus save £400,000 a year, they would also save £40 000 on confinement cases, for which a special payment was to be made, £100,000 on charitable aid as the result of new and increased pensions, and £10,000 on administration expenses The whole saving of £550,000 would reduce local body levies by £275,000

nd hospital rates by about one third This saving would be largely cancelled out by increased building but the building would have to be gone on with in any case

After outlining other proposals Mr Nordmeyer referred to the cost Some say that we can t find the money but if there were a war to morrow we would have no trouble in finding the money Of the total cost £7 575,000 would come from the tax of 1s in the £ on wages and income and the 5s quarterly levy and £7 092 000 was already being contributed from the Consolidated Fund that left £3 120 000 to be found

It would appear that Mr Nordmeyer is basing his estimate of cost on the original proposals These however have been expanded and the cost of the full plan will be much more, in the opinion of the actuary sent out from Great Britain to advise on questions of finance

July 30 1938

ENGLAND AND WALES

Nursing Inquiry Views of London Hospitals

The Voluntary Hospitals Committee for the County of London which functions as the London Regional Committee of the British Hospitals Association, has prepared a statement of evidence for submission to the Interdepartmental Committee on Nursing The statement is based on observations forthcoming from the London voluntary hospitals With regard to one of the principal difficulties in recruitment—namely the fact that nurses cannot begin their training until the age of 18 or 19, whereas they have left the secondary schools at 16—the committee holds that any lowering of the age is undesirable but suggests that hospitals should register candidates on leaving school with the object of keeping in touch with and advising them as to appropriate occupations in the interval Such registration might be made at one general office for all hospitals in a region and extended to include the registration of all applicants to individual hospitals so that those not accepted by the hospital to which they originally applied might be taken by another Such a bureau might further be available for inquiries as to qualifications and facilities for the establishment of effective regular contact between hospitals and education authorities, and to act as a public relations department in respect of nursing in voluntary hospitals Other suggestions are that the General Nursing Council should encourage affiliation of special with general hospitals for the purposes of nursing training and that the syllabus should be rearranged so that candidates may take Part I of the Preliminary State Examination before joining the hospital and proceed to the hospital wards equipped for their practical clinical training The hospitals are fairly unanimous in favour of the retention of hospital examinations which serve a useful purpose in grading the nurses, and the view is that they cause no hardship if taken just before the Final State Examination

Turning to conditions of service the statement of evidence declares that accommodation for nurses in London is generally good So far as restrictions are concerned—a real or fancied deterrent to recruiting—it is considered by the committee tendering evidence that there is need for close and detailed comparisons of hospitals in this respect with a view to the general adoption by all of them of the maximum measure of freedom which *experience at one hospital has shown can be safely* granted Experiments in living out should be encouraged in appropriate cases—for example in the case of probationers whose homes are within easy distance of the hospital The recommendations of the College of Nursing for a 96 hour fortnight and specified rates of pay are generally regarded by the voluntary hospitals of London as the ideal towards which each hospital should approximate as nearly as its resources permit In one hospital (South London Hospital for Women) the 96 hour fortnight has been established not by increasing the nursing staff but by the employment of non resident female ward orderlies who relieve the nurses of domestic tasks If the recommendations of the College of Nursing were carried out in London the increased maintenance cost would amount to about £150 000 per annum and the Voluntary Hospitals Committee does not see how expenditure of that order could be incurred without some form of assistance from the State If the standards proposed by the College are adopted it is considered essential that the hospitals should be provided with grants of comparable size and that such grants would be least likely to interfere with voluntary support generally if they were given in recognition of the services rendered by the hospitals in the training of nurses

Other bodies which have prepared evidence for the Interdepartmental Committee include the General Nursing Council the British Medical Association (see Supplementary Report of Council *Supplement* June 18) the London County Council the Women s Employment Bureau and the Student Nurses Association

Red Cross Rheumatism Clinic

The eighth annual report of the British Red Cross Society s Clinic for Rheumatism covering the year 1937 stresses the urgent need for more accommodation So heavy was the demand for treatment that during two periods of the year no new women patients could be admitted In the general department attendances numbered 90 884, and treatments 134 184 in the private patients department the respective figures were 7 949 and 11 408 The report points out the importance of early treatment in cases of rheumatism For this reason four evening clinics are held each week, and sufferers from early manifestations of rheumatism are thus able to attend for consultations and treatment without absenting themselves from their daily work It is stated that these evening clinics are extremely popular and well attended Innovations during the year include the provision of plaster splints which the patients can slip on and off themselves as required and the weekly attendance of a chiropodist With regard to footwear it is stated that too short stockings and socks appear to be an even more fruitful cause of foot trouble than incorrect shoes Often the patient is found to be wearing stockings several sizes too small This is especially the case among poorer patients for in the cheaper types of stocking the thread is overstretched so that wetting produces much shrinkage The report records a considerably increased financial deficit and states that larger resources are required if the work is to be carried on on the present scale

Port Hygiene at Liverpool

The annual report for 1937 of the Port Health Authority Liverpool, describes the outbreak of paratyphoid fever, with a concurrent smaller outbreak of Sonne dysentery which affected a closed community, the boys in a Mersey training ship, during the months of September October and November The first case of illness was a new boy shown to be a urinary carrier of *B paratyphoid* B Out of a total complement of 128 eleven boys were definitely paratyphoid while four more were doubtful In addition five cases of dysentery were admitted to hospital Routine examination of faeces revealed a Sonne dysentery carrier as a possible cause of origin One of the cases of dysentery was *discharged from hospital on September 28 to be re*admitted five days later with paratyphoid fever It would appear that while suffering from the former he had been incubating the latter disease During the year under review 161 cases of infectious sickness were landed from ships A cruising vessel which arrived at Liverpool in September reported that four passengers and one officer were suffering from dysentery Several members of the crew fell ill during the next four days besides one passenger who was staying at a local hotel All

the patients were removed to hospital, where, with the exception of one passenger who died they made a satisfactory recovery The vessel had taken on board fruit, vegetables and live crayfish at Casa Blanca fruit, vegetables and a hundred tons of water at Madeira This water was mixed with the water originally taken in at Liverpool and although no organisms of the dysentery group were discovered the bacterial count proved unusually high It seemed probable therefore, that this water was connected with the outbreak The tanks were cement washed and no further cases occurred during the vessel's subsequent voyage With regard to the hygiene of crews spaces the Medical Officer of Health deplores the large number of quarters infested by bugs and the apathetic attitude too often adopted concerning this problem Strong disciplinary measures and constant propaganda on the necessity for personal cleanliness are advocated in addition to more thorough methods of disinfestation It is less difficult to keep bugs out of crews quarters than to kill the insects once introduced '

The Ross Institute

Mr A Chester Beatty chairman of the Consolidated African Selection Trust has accepted the vice-chairmanship of the Ross Institute of Tropical Hygiene, London School of Hygiene and Tropical Medicine in succession to the late Sir Harcourt Butler Dr A J R O Brien has accepted membership of the Ross Institute Standing Committee in succession to the late Sir Thomas Stanton Dr G Macdonald at present medical officer in charge of the Ross Institute Branch in Ceylon which is administered by a committee of the Ceylon Estates Proprietary Association has been appointed assistant director of the Ross Institute and will return to London from Ceylon at the end of the year to assist Sir Malcolm Watson Dr Robert Svensson who has recently toured East and West Africa on behalf of the Institute has been appointed assistant director, and will take up the appointment of medical officer of the Ceylon Branch in succession to Dr Macdonald Dr J W Foster has been appointed assistant director, and will take charge of a new branch in the Gold Coast at the end of the year The Branch is being financed by a group of mining companies Before taking up their appointments Dr Svensson and Dr Foster are making a tour of the East, during which they will see the malaria control work and the health organizations in the planting and mining districts

London County Council Hospital Services

The London County Council has decided to provide a portable x-ray unit at seven of its acute infectious diseases hospitals A full-time position of radiographer is to be added to the fixed establishment of staff for allocation for one session a week to each of the hospitals One infectious diseases hospital is already served to the extent of one visit a week by a full-time radiologist This arrangement will be continued but at each of the remaining hospitals it is considered that fortnightly visits will suffice The services of a consulting radiologist will therefore be needed for a total of four sessions a week The rate of remuneration will be £350 a year or if he is already employed as a part time consultant or specialist in the hospitals service £300 a year, with additional payment of two and a half guineas for each emergency visit in excess of the number of routine visits A new children's block, comprising wards for thirty children and an out-patient department will shortly be ready for occupation at Mitcham Hospital The opening of the wards for the reception of in patients will be deferred for a time, but the out-patient department will be brought into use as soon as the accommodation for it is ready As an experiment whole time dental surgeons have been employed in recent months at two L C C general hospitals, and, the success of the scheme justifying the experiment it is proposed to extend it to two other general hospitals Provision is also to be made for an increase in the number of dental sessions at two special hospitals, and for two sessions a week to be provided at another special hospital where hitherto there has been no such provision at all Of the tuberculous patients who received institutional treatment under the council's tuberculosis scheme, and were discharged in 1932, the number traceable being 3,374, it has been ascertained that after five years 42 1 per cent of patients with the pulmonary form of the disease and 74 6 per cent of patients with the non pulmonary (surgical) form are still alive

IRELAND

Medical Members of the Senate and the Dail

The poll for the Eire Senate election closed in Dublin on August 17, and the complete results of the election are now available Mr H L Barniville, M Ch, senior surgeon to the Mater Misericordiae Hospital, was elected for the National University of Ireland constituency, and Dr Patrick J Doyle of Offaly was elected on the cultural and educational panel of the Senate The only other medical man elected is Dr R J Rowlette, professor of materia medica in Trinity College, who was returned unopposed as one of the three senators for the Dublin University constituency But in addition to the forty nine elected members the Prime Minister, Mr De Valera, nominates eleven others to make up the poll to sixty For the previous Senate, which was elected six months ago, he nominated Dr Robert Farnan, professor of obstetrics and gynaecology in University College, Dublin, and it is thought that he is likely to do so again on this occasion In the Dail Eireann, whose full membership is 138, there are the following members of the medical profession Dr James Ryan (Minister for Agriculture), Dr Francis C Ward (Parliamentary Secretary to the Minister for Local Government and Public Health) Dr Joseph Hannigan, Dr Francis Humphreys, Dr Thomas F O Higgins, and Dr Sean Tubridy

The Rotunda Report

The report (1936–7) of the Rotunda Hospital, Dublin, records considerable progress in the reconstruction programme, despite the adverse effects of a six-months strike Among the improvements noted by the Master, Dr A H Davidson, are the enlargement of the main labour ward permitting increased space for a gallery for students and graduates, and the provision of a room for newly born infants with eight special electrically heated cots Attendances in the out-patient department reached the large figure of 26,372 , in the pre-natal clinic 10,057, an increase of over 2,000 on the previous year The report stresses the importance of the V D clinic owing to the reluctance of this type of patient to attend the venereal centres in the city Thirty-three of the 224 Wassermann tests were positive, and thirty of the patients attended for anti syphilitic treatment during pregnancy As a result fifteen living infants were born, and these were treated with bismuth until 6 months old There were 2,301 calls on the hospital district, and 1,944 women were delivered Among this number were three maternal deaths and seventy stillbirths, twenty-six of the latter occurring in premature cases In 265 cases the baby was born before the arrival of the students There were two sets of triplets Admissions to the maternity department totalled 3,212, deliveries 2,851 Of these deliveries 2,585 were normal vertex presentations, three transverse, and one brow , fifty persistent occipito-posterior presentations, and sixty cases of twin pregnancy , nineteen cases of prolapse of the cord nineteen of placenta praevia, and ten of post partum haemorrhage three cases of rupture of the uterus and fourteen of eclampsia Hospital deliveries showed a morbidity rate of 3 68 per cent The mortality rate was 0 45 per cent in the hospital, while the total mortality rate, including external maternity, was 0 33 per cent

Correspondence

Maternal Mortality Rates

SIR,—How misleading as to the true state of affairs isolated statistics can be is shown in the list of towns showing their respective maternal mortality rates for the year 1937 and mentioned by Dr A Massey in your issue of August 13 (p 337)

In the town in which I am particularly interested the total births per annum are very much under one thousand so that the figure given of 1·56 per 1 000 for maternal deaths from sepsis really means that one death happened to have occurred in that year This was a case of an unmarried mentally defective woman in a generally most unsatisfactory condition The rate in 1936 was *nil*

In so small a number of births the total maternal mortality rate in any one year is also misleading for one death makes such a difference in the figures As a matter of fact if the maternal mortality rate had been given over a number of years for this town it would have been about half the figure quoted Had the year 1935 alone been taken the total maternal mortality rate would have had to be quoted as *Nil* —also misleading as to the real mortality—I am etc,

W G WILLOUGHBY
Eastbourne August 22 Medical Officer of Health County Borough of Eastbourne

Hormone Therapy in Mastitis and Breast Cancer

SIR,—We have received numerous inquiries concerning certain statements which have been made in a letter by Dr Alfred A Loeser in your issue of August 6 (p 319) One of these statements is as follows

> So far as cancer of the breast is concerned it is advisable to treat patients who have already undergone a radical operation prophylactically with high doses of male hormone every year In my opinion this is a better method of avoiding a secondary deposition than irradiation especially in families in whom cancer is hereditary I have done this in two cases of breast cancer

This opinion appears to be based on only two cases of breast cancer and it is not stated how long they have been kept under observation As it was only in 1936 that Miescher, Wettstein and Tschopp first prepared testosterone propionate and it is only comparatively recently that the substance has been available the follow up of these patients cannot have been for more than two years there is no proof that a recurrence of the disease would have taken place within this period without any prophylactic treatment It should not be necessary to draw attention to the elementary rule in clinical research that before a certain treatment can be said to prevent the recurrence of carcinoma it should be employed in a reasonable number of patients with an adequate number of controls receiving either no treatment at all or some other form of treatment such as irradiation with which the therapy under trial is being compared and that both groups be followed up for some years

It is dogmatic statements such as the one cited above founded on evidence that is extremely meagre or even non-existent that will tend to bring British clinical endocrinology into disrepute—We are etc,

A W SPENCE
London August 18 GEOFFREY KEYNES

The Prontosil Group in Brucella abortus Infections

SIR,—I have read with great interest the article in your issue of August 13 (p 342) by Dr C Z Neumann on The Treatment of Undulant Fever with Prontosil The twenty cases which he there analyses appear to be all cases of *Brucella melitensis* infection and it may therefore be of interest to your readers to know the results which have been obtained with prontosil and closely related substances in my series of *Brucella abortus* infections in England and Wales

Such treatment has only recently become fashionable and consequently there are only thirty five cases so treated in my series Prontosil itself was used alone in fifteen cases in two of which it was reported to have had a good effect in one case it gave doubtful benefit in seven cases it gave no benefit and in the remaining five cases the effect is not known Prontosil soluble was used by itself in only one case, and in this case benefit was obtained Sulphanilamide was used in seventeen cases—in ten with good effect in three cases with doubtful effect in one case no benefit was obtained and in the remaining three cases the effect is not known In one of these cases treated with sulphanilamide diarrhoea and vomiting followed the administration of the drug, and in another case intense cyanosis was reported Prontosil soluble was used in conjunction with sulphanilamide in two cases once with good effect and on the other occasion with none

These results though relating to a small number of cases justify in my opinion the continued trial of substances of the prontosil group in the treatment of undulant fever—I am, etc,

Ministry of Health Whitehall S W 1 August 15

Blood Groups and Legislation

SIR,—Dr A G Newell, in his letter in the *Journal* of August 13 (p 376) raises a number of important queries in connexion with blood groups and legislation, and suggests that the British Medical Association should make an authoritative statement on this question There is no doubt that in due course they will be officially asked to do so but in the interim some comment upon the present position is pertinent

First Dr Newell asks whether the time has come for legislation As a race we are notoriously apt to sit on the fence and watch the world pass by a mode of life conducive to profiting by other people's mistakes but with the concomitant disadvantage of being eternally behind in general progress Used first in 1923 statistically proven in 1926 amplified in 1929 and proven over and over again since then the blood grouping test in disputed paternity passed England by until May of this year The answer to Dr Newell's first question is that the time has, in fact almost passed It is unnecessary to detail the various societies and bodies both legal and medical which have been approached and which are in accord as to the desirability of introducing legislation Suffice it that the general consensus of authoritative opinion is that the time has come With this knowledge the Association of Clinical Pathologists was approached and set up a special committee which sat earlier this year to inquire into the technique of the test as it should be applied in medico legal cases The resolutions of that committee were placed before Lord Merthyr who has incorporated them in the draft of the Bill which he is to introduce into the House of Lords next session and which makes the performance of a test a necessary condition of the further hearing of a

case if it is asked for by either party or by the court itself The remainder of Dr Newell's first question is best answered from the findings of this committee and from the draft of the Bill

He asks pertinently what system of grouping is to be recognized There are, allowing for the subdivisions of the four main groups eighteen possible blood groups which might be used and which in fact are used in the Scandinavian countries The technique of the tests employed in differentiating the A_1 and A subgroups is extremely specialized and can only be fairly used in a laboratory with a full-time serological staff to which *all* the blood tests are sent (such as is the case in Copenhagen) This appears impracticable in England and it is proposed to limit the test to the four main blood groups—O A B and AB—together with their threefold subtypes—M N and MN—for the present Moreover the cell agglutinogens alone will be tested thus obviating the difficulties which arise with possibly weak or immature agglutinins

The rest of Dr Newell's second question consists essentially of practically every red herring known to the study of blood groups and although dogmatic statements are always undesirable the herrings can only reasonably be caught with such hooks Matta of Cairo proposed a new theory of blood-group inheritance (which was not accepted at the International Congress of Microbiology in 1936) to explain an AB father with an O child this occurring in a relatively minute series of some ninety odd families The statistics of familial groupings are littered with AB fathers and O children which having regard to the axiomatic *pater semper incertus* of Roman law, have very properly been relegated to illegitimacy One cannot accept father–child combinations as proof of any theory of heredity in man, it is only the mother–child combination which provides proof and of all the thousands of AB mothers we have examined only one has ever had an O child (the Haselhorst case which is susceptible of explanations other than that the theory of blood group heredity is at fault) while no O woman has ever been found with an AB child The same considerations apply to Bauer's theory of heredity

The remainder of these red herrings may be dealt with more tersely The implied criticism of the theory of heredity in the sentence 'Several parents of A_1 group were found who had given birth to O children' is symptomatic of complete misunderstanding rather than intelligent criticism There is no reason why an A_1 parent should not have an O child and this is the first time so far as I am aware that such a suggestion has ever been made In fact the statistical odds are that such a parent *will* have an O child For the rest the fact that the so-called A agglutinin agglutinates O cells is well known but is in no way relevant to the performance of a blood-grouping test the fact that the M and N agglutinogens are separate from the A and B substances both serologically and genetically far from negativing their value gives them their strength and lastly the normal constituents of the red cells the agglutinogens *cannot* be present or absent according to the state of health or disease of a person but are present or absent only according to the state of the germ cells of the parents who begat him Moreover these agglutinogens are present not only in the red cells but in all the body tissues fluids and secretions as well the term blood group deriving from their method of discovery thirty eight years ago

Thirdly Dr Newell inquires after statistics stating that these are not generally agreed upon Not generally known would be more correct for the chances of exclusion of an innocent man vary only with the distribution of the groups among the relevant population ranging in England from 1 in 12 in Group AMN to 2 in 3 in Group ABN, with an average of 1 in 3 It is unnecessary to quote the complete exclusion tables, for they are legion among the literature of blood groups

The most important points of Dr Newell's letter he in his last three questions First what sera should be used? It is admitted, and is indeed obvious, that the crux of the test rests on the sera that are used, which must be at the same time entirely group-specific and yet potent enough to detect the weakest of agglutinogens Moreover the preparation of M and N antisera is notoriously difficult To overcome this the present suggestion is to establish a central source of supply *every* blood test in paternity cases being obligatorily made with serum from this source the serum being supplied on the day of the test, and having been titrated checked, and certified the day before Given these sera the person making the test will simply read the results, having followed a standardized technique and fill in a standard form of report, which will state that the test was made with a particular batch of serum certified by the central source

The pathologists making the test would be recognized by the Lord Chancellor and placed upon a panel of approved persons In this connexion the committee of the Association of Clinical Pathologists was emphatic in the view that only registered medical practitioners should be approved persons and that the test should not be delegated to laboratory assistants So far as the giving of evidence is concerned, it is of course, essential that the report should be acceptable as evidence without the attendance of the pathologist at court by which means the cost of the test is reduced and valuable time is saved Attendance at court would only be necessary if it was specifically asked for by either of the parties The proposed Bill makes the requisite provision for this, the precedent being found in the acceptability of a certificate of the analysis of milk under the Food and Drugs (Adulteration) Act—I am, etc,

London W 1 August 19 JOHN C THOMAS

Rheumatoid Arthritis and Jaundice

SIR—I have just read the very interesting paper by Dr P S Hench in the *Journal* of August 20 (p 394) on the effect of natural jaundice in alleviating symptoms of rheumatoid arthritis May I, very humbly as befits one of the rank and file, suggest that the important factor may not be the presence of bile in the blood stream but rather its absence from the intestine, with all that this implies as to its cultural, chemical, and solvent activities? This view would appear to be a useful line of research for a combination of surgeon, bacteriologist, and biochemist—I am etc

Stoke Poges, August 21 W L PEACOCK M B B Ch, D O M S

Antagonistic Diseases

SIR—Dr Philip S Hench's article, Effect of Spontaneous Jaundice on Rheumatoid Arthritis almost makes one believe that the cessation of symptoms which he describes may be yet another sign of a new era in therapeutics

I myself was particularly interested since you were good enough on February 27, 1932 to publish a letter of

mine entitled Antagonistic Diseases in which I pointed out that the recovery of some chronic invalids when they contracted an additional complaint was not always necessarily a matter of coincidence and that if only sufficient data could be obtained it would be found that there were far more of these accidental cures than one would have thought possible

My letter was suggested by a questionary that had been circularized about the incidence of cancer In it I believe, we were asked to give fairly full details of the medical histories of our cancer patients I hazarded that with regard to treatment and prevention much more practical results would be obtained from statistics stating what cancer patients had *not* suffered from, rather than the associated complaints

Supposing for instance it were found that very few cancer patients had ever had diabetes, say, and that the converse was equally true how pertinent that would be —what a pointer to additional research! Or, leaving cancer out of it, one might find that in the realm of diseases there were many likely combatants Chicken-pox might be found to be antagonistic to poliomyelitis—who knows?—hyperthyroidism to disseminated sclerosis, and so on

Of course I am not suggesting that we should necessarily infect the patient with a suitable antagonistic disease because in some instances the cure would be worse than the complaint But Nature is not so prodigal with her therapeutic clues that we can afford to despise any of them, however fantastic or unreliable—I am etc,

Southsea August 21 E GRANGER

Small-pox and Vaccination

SIR—Regarding Dr C Killick Millard's letter in the *Journal* of July 16 (p 151) in which he supposes that Dr A L Craddock is entirely out of touch with the questions of aetiology and prophylaxis of small pox I should like to mention the following case

In 1925 while acting as Staff Surgeon Calcutta I visited families under my care to ascertain the extent of protection from small pox by vaccination in view of an outbreak of the disease In one case the mother and three children were all unvaccinated The mother stated that she did not believe in vaccination On pointing out that she was of age and could judge for herself but that the children should not be unduly exposed she reasonably agreed to their being vaccinated About two months later the poor woman suffered from a very severe attack of small pox which nearly proved fatal She had been a pretty woman but after the attack she was very deeply pitted and all her beauty was lost The children did not contract the disease

Anyone who has experience of medical problems in India will have no doubt on the subject of adequate protection from small pox by vaccination I wonder if Dr Killick Millard has read Dr Victor Heiser's autobiography, in which he refers to small pox in the Philippines? (I quote from memory) Dr Heiser was in charge of public health arrangements before self government was given to the islands and compulsory vaccination was in force When the Filipinos assumed government compulsory vaccination was abolished Small pox became rife, and Dr Heiser was recalled to deal with the situation He reintroduced compulsory vaccination, and he states that when he left there were no anti vaccinators alive they were all dead from small pox

In 1925 when on a voyage from Bombay to Marseilles on the P and O liner *Narkunda* I was called in consultation by the ship's surgeon to see a wireless officer who had fever and a suspicious rash This proved to be a typical case of small pox The ship had been three days at Bombay and the patient was the only officer of the ship's staff who was unvaccinated The incident caused the P and O Company much trouble as all passengers were held up for some five hours at Marseilles I understand that the company now insist on all wireless officers being vaccinated as they do for their own staff—I am etc

A D STIRLING
Blackheath August 18 Colonel

SIR—I hasten to assure Dr Fred H Judd (*Journal* August 20 p 426) that he has entirely misunderstood the purpose of my letter in the *Journal* of July 16 in which I took exception to a statement by Dr A L Craddock that there can be little reasonable doubt that the remarkable position [freedom of this country from fatal small pox] is due largely to compulsory vaccination

I am just as convinced as Dr Judd himself is of the efficacy of (recent) vaccination in protecting the individual against small pox and I gave proof of this nearly forty years ago when I took my wife and two young children all recently vaccinated, into our Leicester small pox hospital during an outbreak of variola major and photographed them by the bedside of a confluent case of the disease Nothing which I have experienced in fighting small pox since that time has ever shaken my faith in vaccination which is just as strong to day as it was then And had I to deal with small pox in China as Dr Judd has done I have no doubt I should make use of vaccination just as he does and be just as thankful for it

But all this does not in the least affect my position that it is not compulsory vaccination which deserves the credit for the virtual disappearance of major small pox from this country *If anyone still believes that I would* beg of him to re examine the whole question impartially and *de novo* and I feel sure that he will have to modify his opinion Nor do I wish to stress the word compulsory , I believe that general vaccination of the infant population irrespective of compulsion, has had very little if anything to do with it at any rate in this country

Finally, to soothe Dr Judd's feelings may I say that I would always urge anyone going out to the Far East or to any part of the world where variola major was endemic, to get vaccinated beforehand and this whether he had been vaccinated in infancy or not—I am etc,

C KILLICK MILLARD
Leicester August 21 Ex M O H for Leicester

Undescended Testicle

SIR—I had hoped that someone who knows more about hormones than I do would have answered Dr P M F Bishop's letter (*Journal* August 13 p 374) and expressed doubts which I believe to be fairly widely held about the complete harmlessness of pregnyl After all as it is used to procure a permanent result in the descent of the testicle the argument that it is quite safe because all hormone effects are transient does not entirely reassure me My medical friends tell me that neither insulin nor thyroid extract is entirely harmless in fact that rash use of the latter may disorganize for a long time the entire chemistry that has been stimulated The closest analogy of all seems to me to be with the growth hormones supposing they were used in a developing

child to promote skeletal overgrowth of the degree of the genital hypertrophy often seen after pregnyl, would one be entirely confident that no harm had been done?

As to Mr R C Brock's letter (August 20, p 423), it seems a trifle hard to be accused of 'flogging a point to excess' (see H W Fowler on Metaphors) when all I have done is to say to a succession of critics that I wish they would read my paper carefully before attacking it. Had Mr Brock followed this apparently uncommon course he would have seen that we are in complete agreement on the subject of the superficial inguinal ectopic testis. Like him I mentioned that it was "well recognized by certain workers", like him I referred to the work of a respected senior in regard to it. The rest of my paper was about something quite different, which is possibly original: the superficial inguinal pouch, the excursions of normal and abnormal testicles into it, and the differing prognosis of the different positions.

I cannot quite see why he should say that my suggestion that some (not, as he says, most) examiners do not recognize the superficial inguinal ectopia is grossly unfair, when in his next sentence he admits the same thing. And surely it is unkind to suggest that they expect from unfortunate examinees a piece of information that is not in the textbooks they write or recommend.

As a final contribution to this correspondence, which has both amused and instructed me, I would like to say that if anyone can prove to me upon an actual case that any of my statements are wrong I shall willingly admit it in these columns.—I am, etc,

London W 1 August 22 DENIS BROWNE

Sulphonamide Chemotherapy in Gonorrhoea

SIR,—I hope you will allow me to congratulate Dr G L M McElligott and Mr A J Cokkinis on their paper in the *Lancet* of August 13. I, with all who have on them the constant harassment of gonorrhoea cases, feel much in their debt for the long patient care, clinical acumen, and obviously unremitting labour they have given to observing the effects of sulphonamide drugs in gonococcal infections. Their analysis supports their confidence in that drug, and for my part, should I again use sulphanilamide for gonococcal infections, I shall follow their technique. Indeed, they have persuaded me of its superiority to that I had used once upon a time (*Brit J Vener Dis* **14**, 1, 1938).

I am sorry to read (*British Medical Journal*, August 20, p 424) they feel that my letter to you of August 6 may give an erroneous impression of both the efficacy and toxicity of uleron. As to toxicity, it actually ought not to—not to the critical reader. For my letter did state doses and spacing of doses, given to 212 cases of gonorrhoea in the male over a continuous period of seven months. As to efficacy they find it unfortunate that my claim for uleron's being more effective in gonococcal infections than sulphanilamide was not supported by figures. Of course in my brief letter to you I gave no analysis of figures. I did state, however the number of cases treated with uleron and the number I had treated with sulphanilamide. Yet am I heartened to note that in their paper referred to above, Dr McElligott and Mr Cokkinis did not support their definitely unfavourable opinion of uleron by figures except like myself, to give a number of cases—over 150 cases. Furthermore (let us be accurate as well as critical!) I also wrote in my hands. I am sure I may count on most readers understanding that in my hands meant also in this clinic, with this sort of men—seamen, firemen, stewards, stevedores, and dockers. They are a hearty, intelligent, independent-minded, and matey lot, not backward in discussing and commenting on their treatment and its effects.

I am sorry I must decline to follow the red herring trail of 'final cures" so temptingly laid by my friends Dr McElligott and Mr Cokkinis. I agree with them that most of my patients are 'seamen," and that these seamen *may* have developed their neuritis after their return to sea. I wonder if Dr McElligott and Mr Cokkinis will agree with me that these seamen may *not* have developed any neuritis after their return to sea? In fact, Sir, the majority of them sail from and return to this port at regular intervals of time. They are matey, and do, many of them, blow in again after two to four months' voyage—to report relapse or no relapse, or even "neuritis' or *no* neuritis!—I am, etc,

Albert Dock Hospital, E 16 H M HANSCHELL

B welchii Infection after Abortion

SIR,—In the *Journal* of August 6 (p 279) three cases of *Cl welchii* infection following abortion were described by Drs R Y Dawbarn and Bryan Williams. It may be of interest to record a case of *B welchii* infection which came under my care some years ago and was reported elsewhere at the time.

A woman aged 26 intended to procure abortion herself by making an injection, with the result that a large haemorrhage occurred two days later, causing abdominal pain and rigor. On admission to hospital the patient had no peritonitic symptoms at all. Her temperature was normal, the pulse slightly raised. After packing the uterus with gauze soaked in iodine-glycerin, the foetus of a four months pregnancy was expelled spontaneously, the placenta, which was necrotic, had to be removed manually. When the uterus was emptied the patient felt absolutely all right. Ten hours after admission, however, an embolic attack occurred from which she recovered under morphine. Twenty six hours after admission another embolic attack set in, followed by death.

No doubt an infected thrombosis existed (as had to be assumed from the rigor which the patient admitted) but no general septicaemia. This case, from the clinical point of view, would not have been of special interest had not the post-mortem examination shown a most remarkable picture.

Twenty four hours after death the body of the patient was unrecognizable, and had the appearance as if she had been drowned, with widespread oedema, emphysema, and haematomata. The abdomen had swollen to twice its size, the skin on chest and abdomen was covered with discoloured blisters which discharged a gas with an obvious smell of sulphuretted hydrogen. The skin everywhere especially over the chest, gave a peculiar crackling sensation. Gas escaped also from the abdominal cavity. The spleen was about twice the normal size; the uterus which felt like a snowball showed no mechanical injury nor did the vagina.

The cultures made from the spleen, endometrium and heart valves anaerobically showed a growth of *B welchii* after ninety minutes and distinct gas formation. In the vessels and lymph spaces of the uterus, at the site of the placenta, in the liver and spleen there were great numbers of Gram positive bacilli which could be recognized as *B welchii*. The embolus of the arteria pulmonalis showed an immense number of gas bacilli and a small number of diplococci and streptococci.

What makes this case so remarkable is that during life no gas gangrene sepsis existed. There was no fever, no peritonitis, and no local gas production such as

crepitation of the uterus The clinical picture of a typical gas gangrene sepsis—jaundice cyanosis and scanty dark brown urine as a result of an extensive haemolysis—was absent The gas gangrene sepsis can only have arisen after the second embolic attack Lack of oxygen in the blood after the second embolism made it possible for the *B welchii* to spread in the dying body—I am etc

London N W 6 August 22 ERNST FRIEDMANN

Snake Venom for Oral Haemorrhage

SIR—A patient came to me for extraction of the second and third upper molars on the right side and second upper right premolar all of which were septic with alveolar abscesses She had however a very large cavernous angioma of the right cheek extending over the upper gum in the area of the septic teeth When she was excited or nervous the gum and the whole side of the face pulsated I removed the teeth in hospital under a general anaesthetic and the sockets bled profusely Ordinary pressure would not stop the haemorrhage Packing with adrenaline tape and heavy pressure reduced the haemorrhage but did not stop it, so snake venom in the form of stypven was applied This however did not completely stop it The treatment was applied to the molar sockets The premolar socket which was the worst bleeding area was plugged with stypven soaked in adrenaline tape, and the haemorrhage stopped immediately when this was applied to the molar sockets they also stopped bleeding

A year ago I was called to a haemophiliac after multiple extraction under gas and found the same thing Stypven on ordinary gauze tape or cotton wool was not so efficacious as the venom plus adrenaline—I am etc

Berwick on Tweed August 12

"Psychosomatic Illness"

SIR—May I be allowed, before this correspondence closes, to refer back to the original contention of Dr James L Halliday (*Journal* July 2 p 11) that psychogenic illness judged by screen symptoms is on the increase and is a result of noxious psychological factors in the environment that can be rectified There is considerable reason for a psychiatrist to doubt the interpretation put on the psychological diagnosis the more so as Dr Halliday previously pointed out, that he approached it as physician (fortified by statistics) with no special claim to a psychiatric technique

Dr Halliday's cases of gastritis rheumatism and debility may well be on the increase, but so is the recognition of psychological facts by practitioners He should have recognized that every individual if the surface be scratched will be found to have fairly marked anxiety obsessional, or regression systems in his psyche He may be mistaking a discovered substrate along with a somatic disturbance for a neurosis proper I have reason to believe that this is the case from a recent independent and detailed examination (by psychiatric interview) of over a hundred workless and an equal number of employed men (to be published elsewhere), and it was not difficult to determine what Dr Halliday would have called hysteria anxiety and depressive states in over 50 per cent but the control series showed these to be largely systems and less than a quarter showed actual neurotic illness This is not to deny that organic conversions do occur but the discovery of anxiety etc in rheumatism or dyspepsia does not make for a psychosomatic illness *sui generis*—I am etc

The University St Andrews August 16 P LIONEL GOITEIN

Holiday Colonies for Fitness

SIR—No one realizes more fully than the general practitioner the lack of physical fitness and the prevalence of unnecessary invalidism produced by improper physical and mental hygiene Better housing conditions and improved sanitation have vastly improved the general health of the community but the knowledge of how most satisfactorily to live under these improved conditions is still very deficient How to bring up healthy families how to deal with physical development after school age and how to keep in health in advancing years are matters which lack guidance The habits of improper living are quickly formed and difficult to alter ignorant fears difficult to eradicate

The physical trainer important as he is should not attempt to take the whole burden of physical improvement on himself without the aid of the medical profession He is not capable of doing this nor will the general public or at least the more timid section of it trust him to do so How best to get fit and how to keep fit what and when to eat and drink, how best to obtain mental relaxation from daily work are all things which can only be readily learnt by the practical experience of a definite routine To this end permanent and self supporting holiday colonies should be created available both for families and for individuals Their attractions and value for money should be made so outstanding that the educational side which ought to be compulsory would be accepted even by the obstinate supporters of freedom of action Compulsory medical examination should be one of the first hardships enforced before any programme of physical exertion was laid down I am certain that if the means could be forthcoming to encourage an experiment of this kind good and permanent results would immediately follow—I am etc

Banbury August 10 C J L WELLS B M Ch B

Medical Evidence at Inquests

SIR—Though very ignorant of the habits of coroners I cannot but think and hope that the following action on the part of one is unusual I was summoned last week to a brook where a little boy was said to be drowned I found a police officer and a member of the Fire Brigade already on the spot They were doing artificial respiration and giving oxygen and CO_2 Though I was told the child had been drained I found the mouth full of foam and food and on raising the body a very considerable quantity of food and water poured out Another (local) medical man arrived and gave coramine etc but after another hour we had to pronounce the case hopeless Neither his nor my evidence which might well have been informative was called at the subsequent inquest A medical man from some distance away was employed for this purpose and I am told that this is the local custom Surely this cannot make for the whole truth ?

I wrote to the coroner concerned asking to be informed why my evidence had not been called but so far have not had a reply—I am etc

Earlswood Surrey August 18 J L BARFORD

London Emergency Bed Service

SIR,—I would like to express my appreciation of the London Voluntary Hospitals Emergency Bed Service I understand that it has not yet received the full measure of support it so richly deserves The staff are always refreshingly courteous and do their best to assist one in every possible way

I recently had a patient with an acute generalized eczema for which institutional treatment was essential As this type of case is difficult, if not impossible, to get into the average teaching hospital, I applied to the Emergency Bed Service After three-quarters of an hour's telephoning they got him a bed at last They rang up, in all about ten hospitals Anyone who has tried to do this himself during a busy morning will realize the extreme value of such a service

The scheme is unique and brilliantly simple, its success should be assured by every doctor giving it his support—I am, etc,

Obituary

H R JEREMY, F R C S

Ophthalmic Surgeon and Lecturer on Ophthalmic Surgery, the London Hospital

Mr Harold Rowe Jeremy, who died on August 16 after a long illness was well known as an ophthalmologist in London A native of Merthyr Tydfil he studied medicine at University College, London, the London Hospital, and St Bartholomew's, and qualified as M R C S, L R C P in 1901 He early decided to take up the study of diseases of the eye, and his first post was that of ophthalmic house-surgeon at the London Hospital, after which he became chief clinical assistant at Moorfields, surgeon to the Western Ophthalmic Hospital, and ophthalmic surgeon to the Queen's Hospital for Children and Eastern Dispensary Mr Jeremy returned to the London Hospital as assistant ophthalmic surgeon and lecturer in ophthalmology in the Medical College He had taken his F R C S in 1911 He was also consulting ophthalmic surgeon to St Peter's Hospital, to the Claybury Mental Hospital, and to the Walthamstow, Wanstead, and Leyton Hospital His writings included papers on perithelioma of the orbit, birth injuries of the fundus oculi, cataract in mongolism, and retinal detachment, read to the Ophthalmological Section of the Royal Society of Medicine and published in the *Proceedings* and on cataract following thyroidectomy, published in the *British Journal of Ophthalmology* Mr Jeremy joined the British Medical Association in 1911

Dr JOHN CUTHBERT GEORGE DICKINSON who died in a nursing home at Torquay on August 14, had practised for the past twelve years in partnership at Braunton, North Devon The second son of the late William George Dickinson of Roos East Yorks, he studied medicine at Guy's Hospital and took the English Conjoint diplomas in 1924 followed by the M B, B S Lond degrees in 1926 after two years as house-surgeon to the Taunton and Somerset Hospital and to the North Devon Infirmary Dr Dickinson became honorary physician to the Barnstaple and North Devon Dispensary and medical officer to the Braunton Child Welfare and Maternity Centre, he was also divisional surgeon to the St John Ambulance Brigade and took a prominent part in its activities He took a warm interest in the local affairs of Braunton and for some time had a seat on the Parish Council He joined the British Medical Association in 1929 and was an active member of the North Devon (Barnstaple) Division, serving as its representative on the Branch Council for the last four or five years, and as chairman of the Division in 1933–4

The following well known foreign medical men have recently died Dr A CESARIS DEMEL emeritus professor of morbid anatomy at Pisa, aged 72, Dr A GIANELLI an eminent psychiatrist of Rome, aged 73, Professor A BONANNE a prominent pharmacologist of Rome, aged 68 Dr WALTER JACOBI director of the clinic for psychiatry and nervous diseases at Greifswald, aged 48, and Dr MARTIN HERMAN honorary professor at Brussels University, honorary director of the Hainaut Institute of Hygiene and Bacteriology, and member of the editorial staff of *Le Scalpel*
